

A Filtering cascade

2,400 proteins measured -> 1,920 analysed. Red = removed at that step.

B Contamination per sample, measured before removal

Blood rises at T3 (hyperaemia): +15.3 pp from T2, 14/16 subjects, paired p = 0.0006, and leukocytes rise with it (post-exercise infiltration). Both rises are shared by the arms (group x timepoint p = 0.25), so they cancel in the interaction contrast but confound the per-arm acute contrasts. Keratin and adipose are negligible throughout.

C Outlier consensus, flagged samples only

11 of 48 samples drew any flag; 3 met the >=3-of-4 consensus and were dropped. All three are HR.
