

Module nominal hits relative to chance

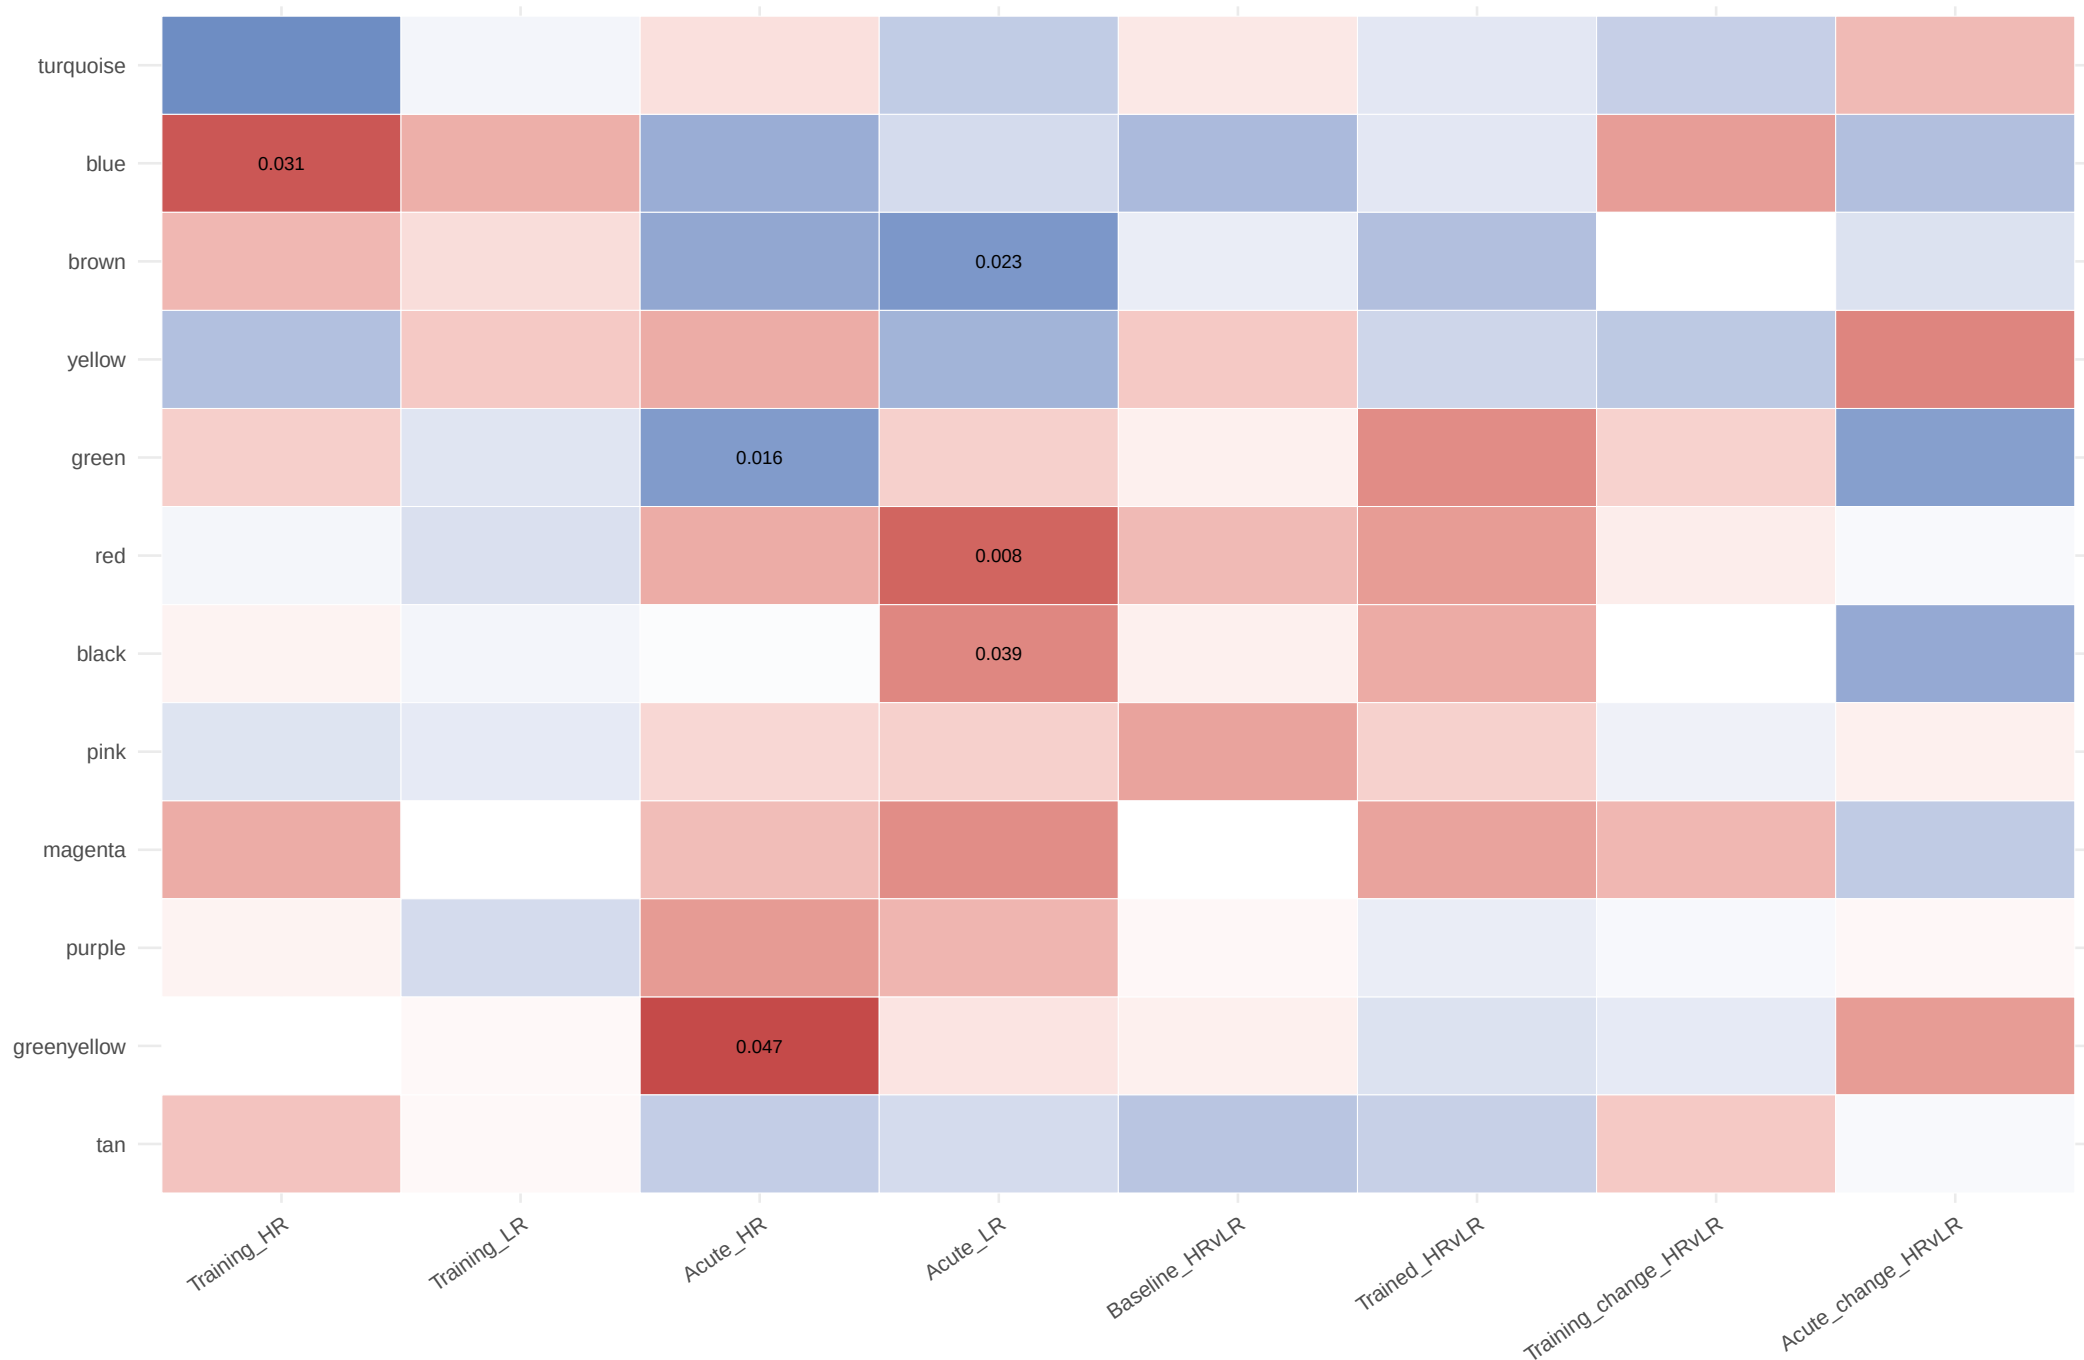

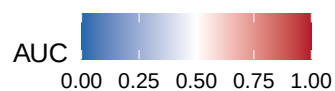

12 modules, uncorrected p

Bar length is nominal hits over 5% of tests. Red clears 1, grey does not. Table: c_data/05_classify_and_associate_modules.xlsx, chance_expectation.

Module classification, every module and task

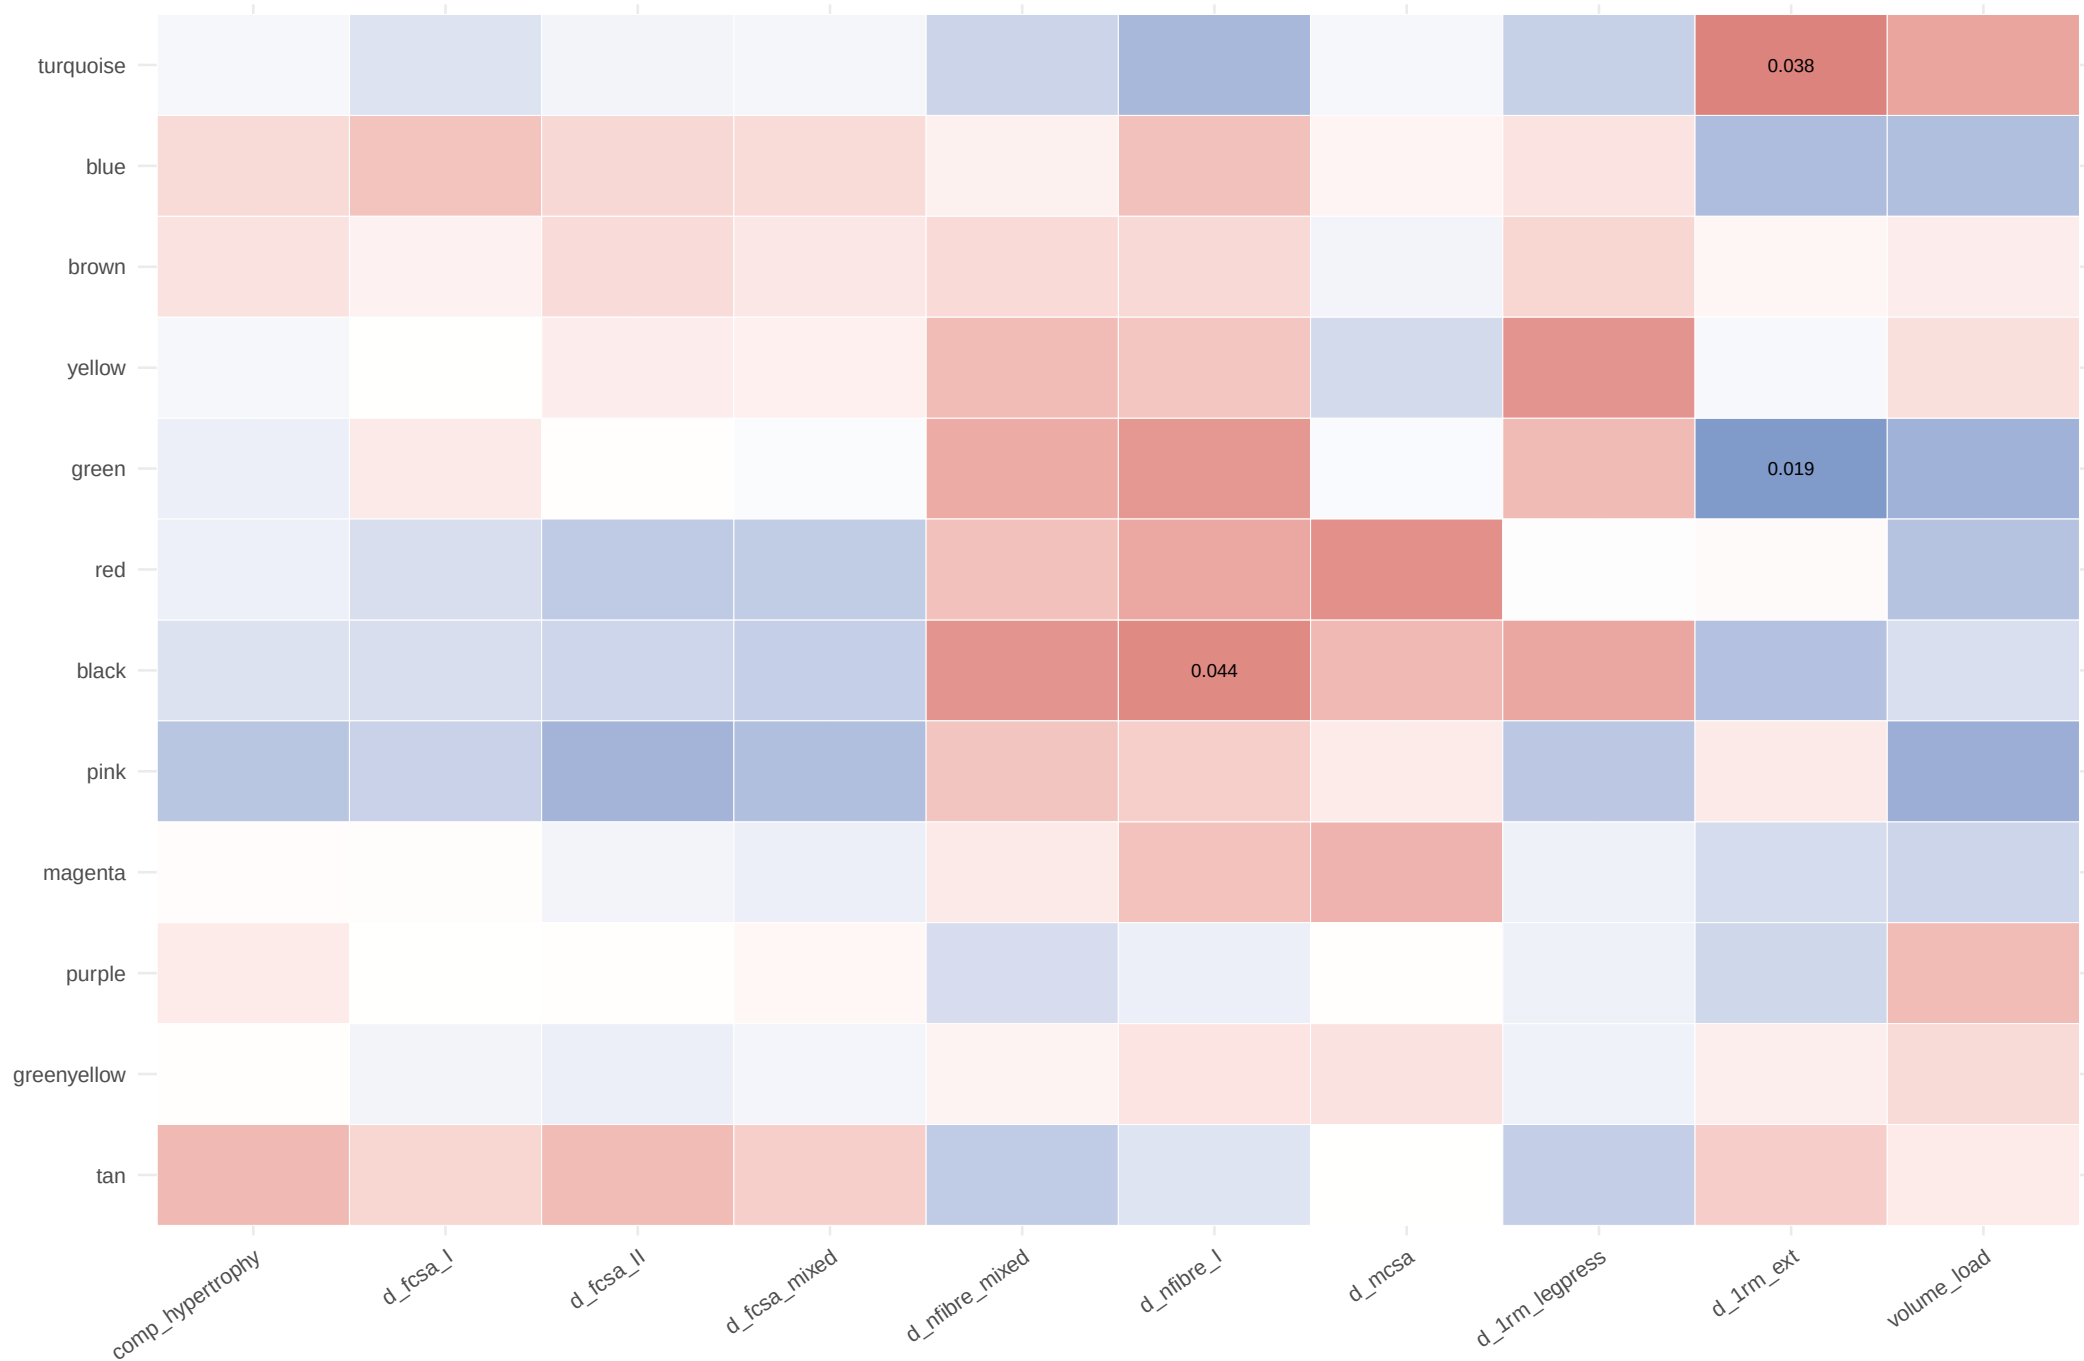

rank AUC, Wilcoxon p (signed-rank within arm), BH within task

Fill: AUC, above 0.5 higher at the later timepoint or in HR. Label: nominal p where below 0.05. Black border: BH < 0.05. Table: c_data/05_classify_and_associate_modules.xlsx.

Module association, training change (T2 – T1)

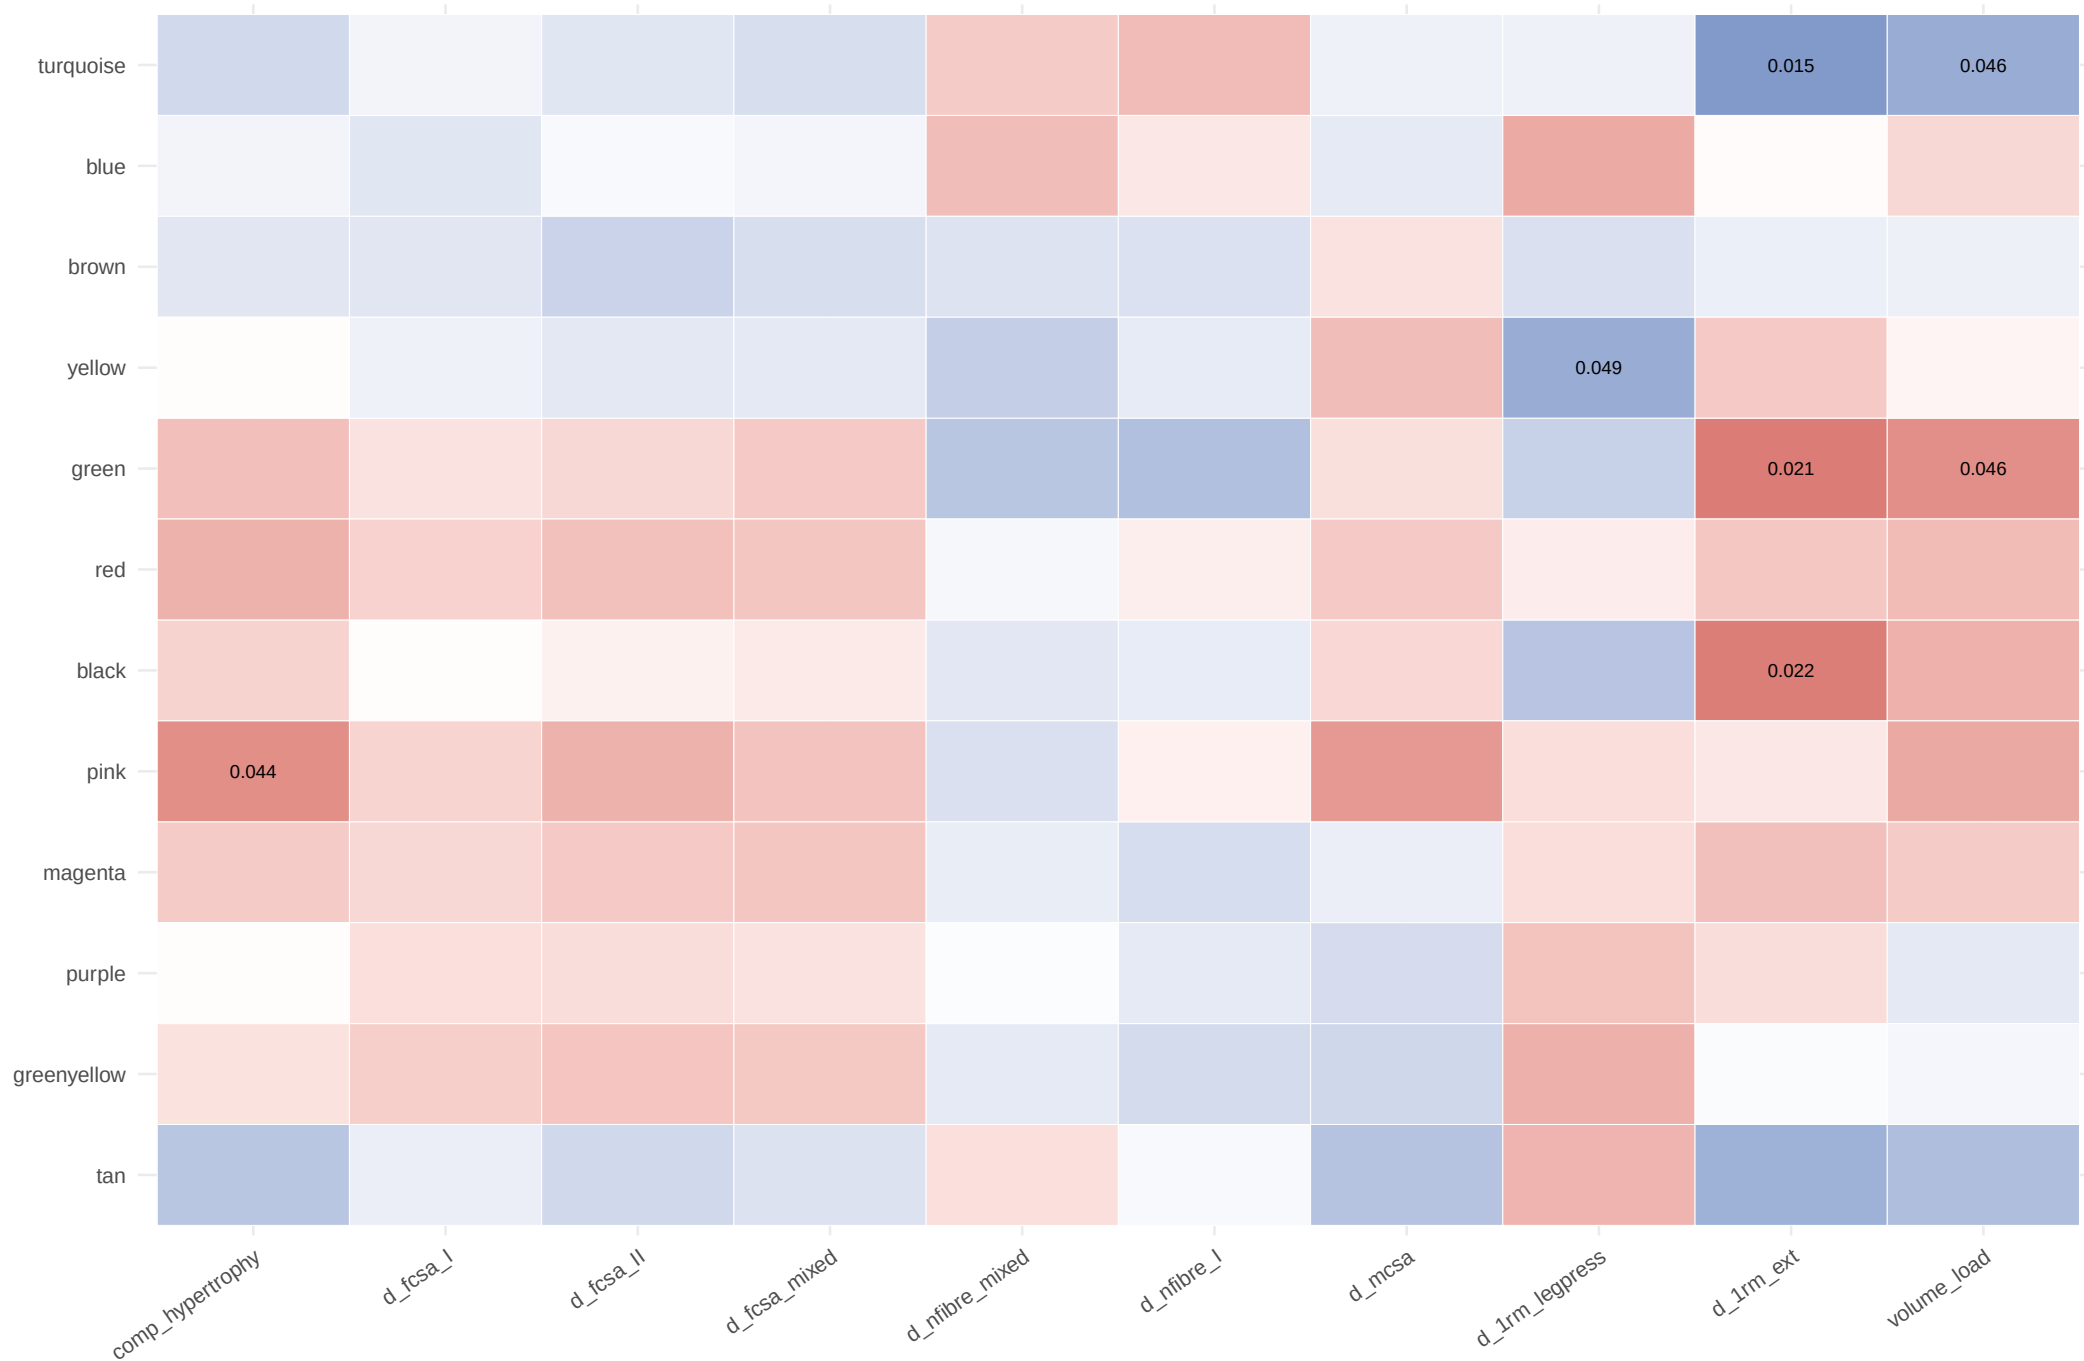

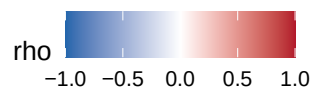

Spearman, subjects pooled, BH within outcome

Fill: Spearman rho between eigengene and phenotype. Label: nominal p where below 0.05. Black border: BH < 0.05. Table: c_data/05_classify_and_associate_modules.xlsx.

Module association, level at T1

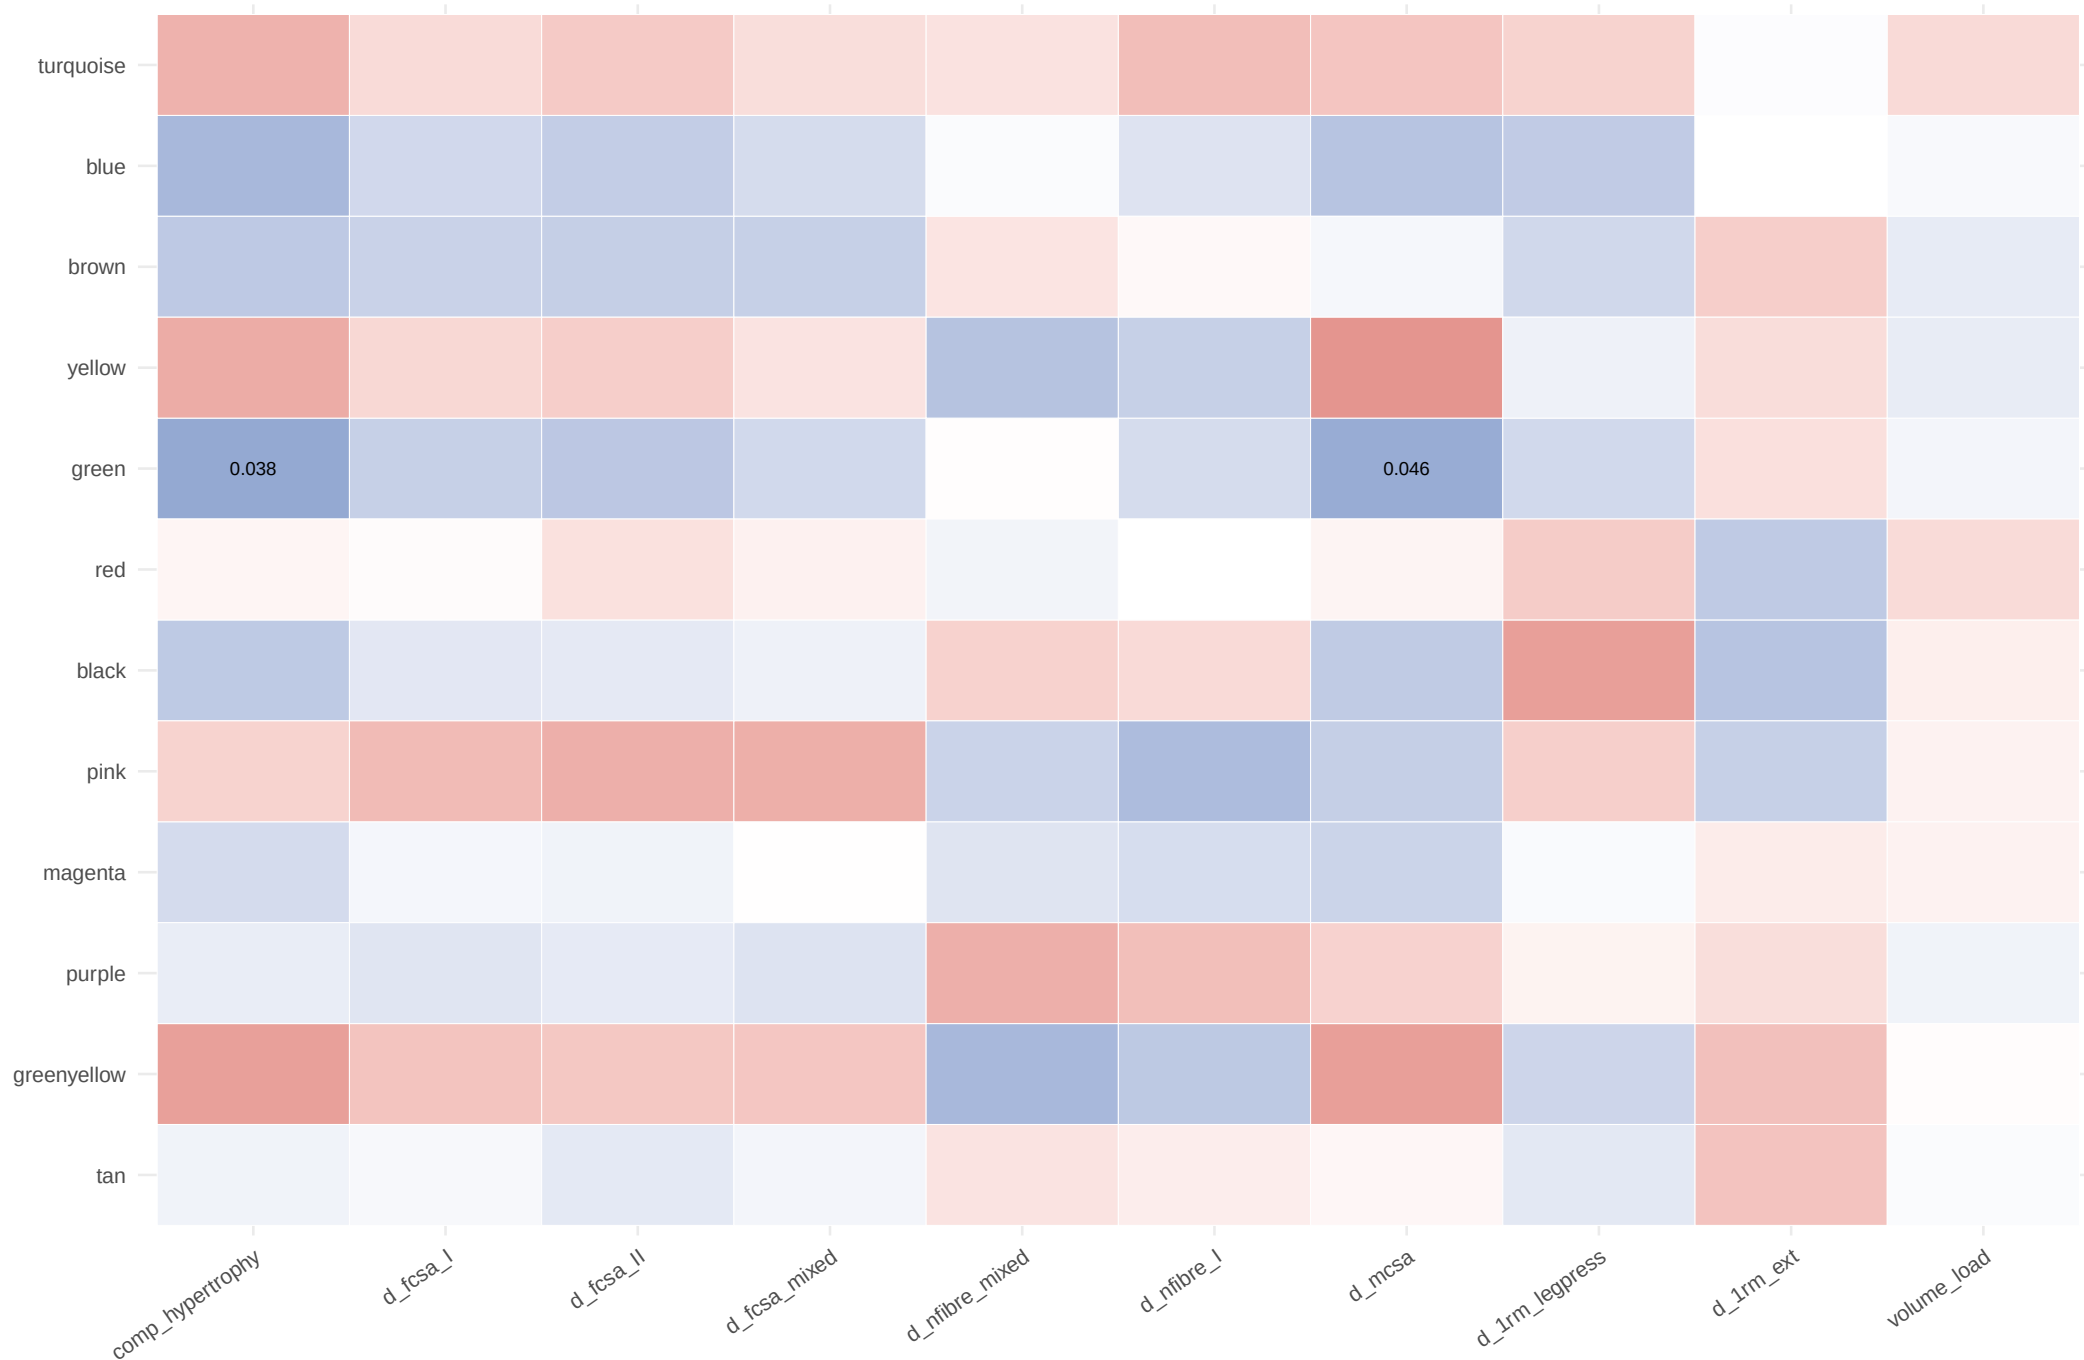

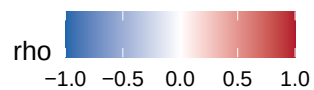

Spearman, subjects pooled, BH within outcome

Fill: Spearman rho between eigengene and phenotype. Label: nominal p where below 0.05. Black border: BH < 0.05. Table: c_data/05_classify_and_associate_modules.xlsx.

Module association, acute change (T3 – T2)

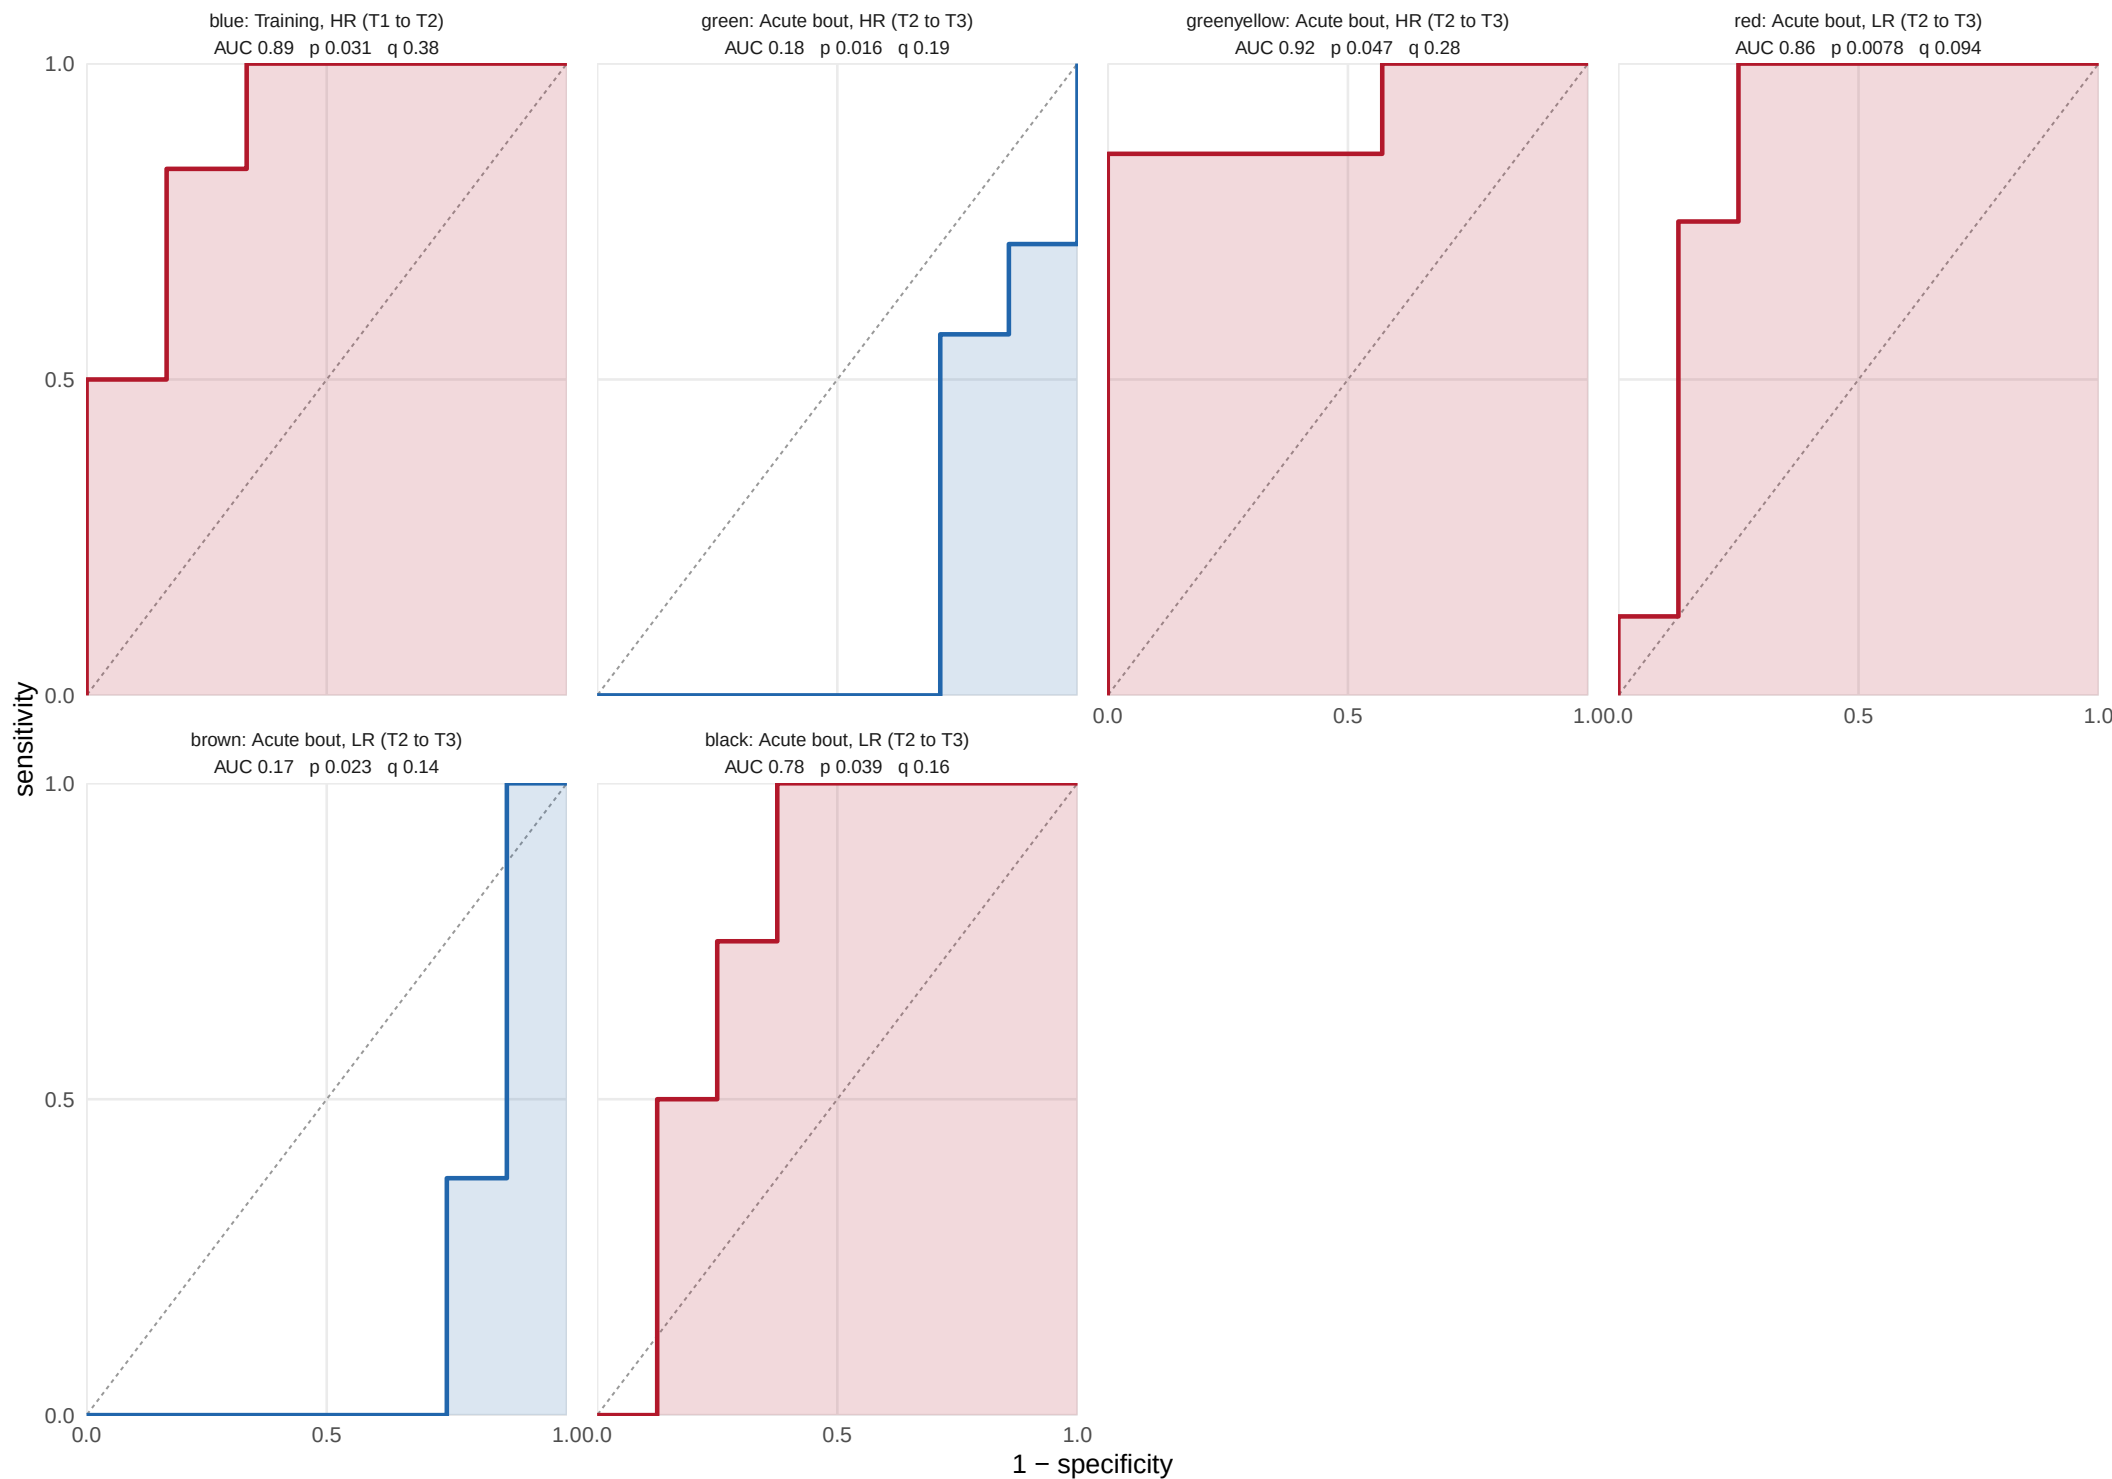

Spearman, subjects pooled, BH within outcome

Fill: Spearman rho between eigengene and phenotype. Label: nominal p where below 0.05. Black border: BH < 0.05. Table: c_data/05_classify_and_associate_modules.xlsx.

Module classification, nominal hits

eigengene per module, AUC with direction fixed

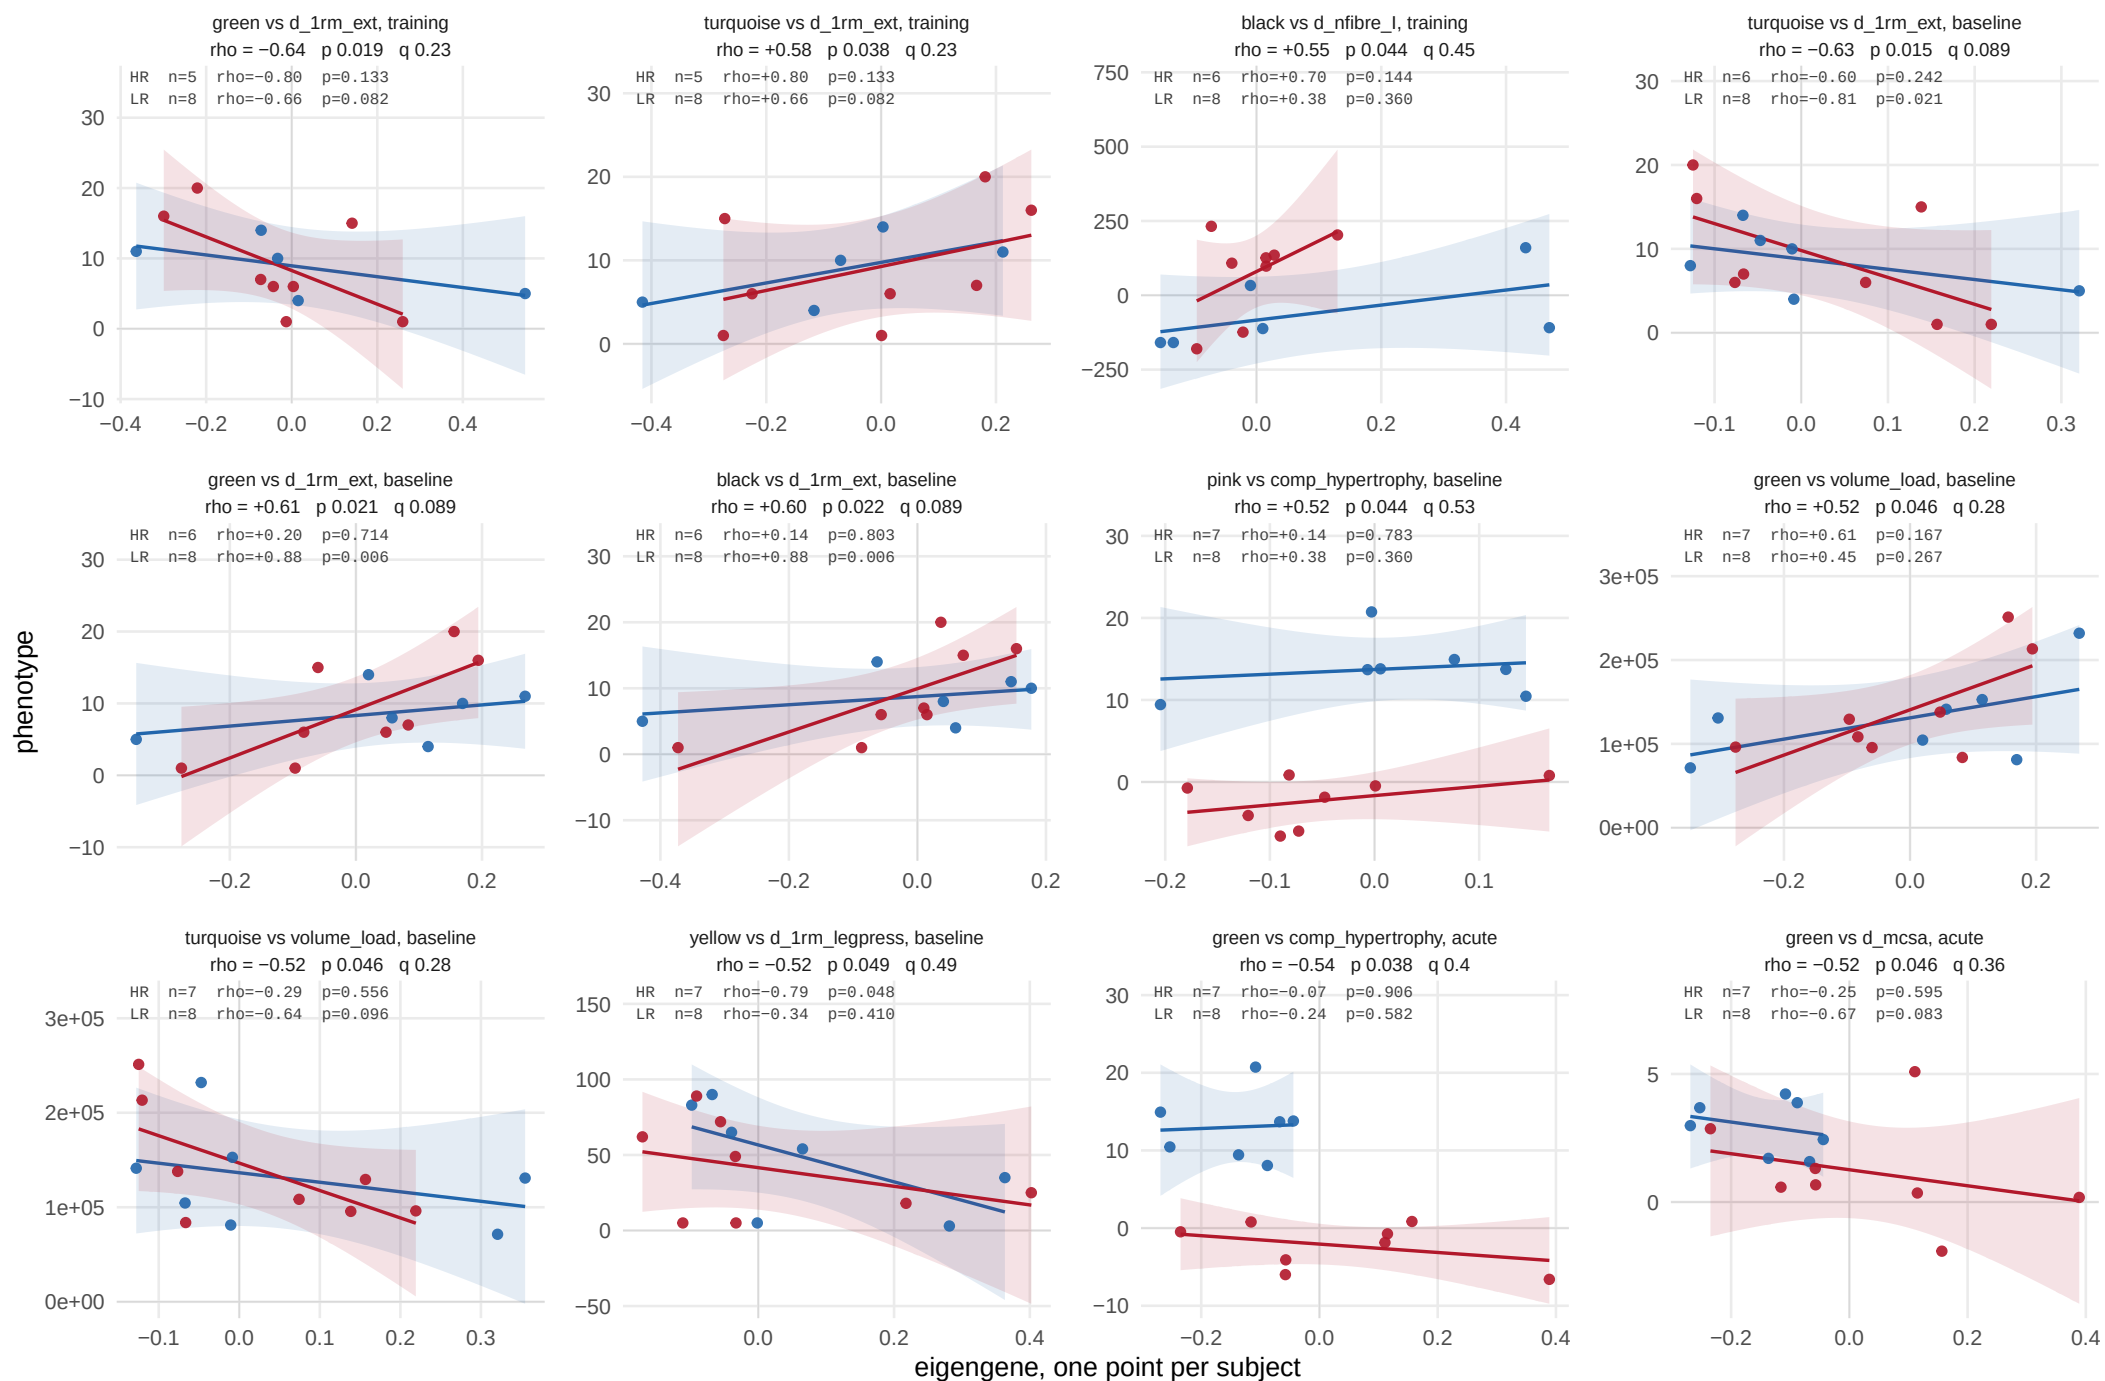

Every module reaching nominal p on a task, by task then p; the floor is excluded. Red separates higher at the later timepoint or in HR, blue lower. p from the Wilcoxon test (signed-rank within arm), q from BH over the 12 modules within the task.

Module eigengene against phenotype, nominal hits

Spearman, subjects pooled across arms

HR LR

Every module–outcome pair reaching nominal p, by window then p. Lines are fitted within each arm; the header rho is the pooled correlation, q from BH over the 12 modules within window and outcome.
