
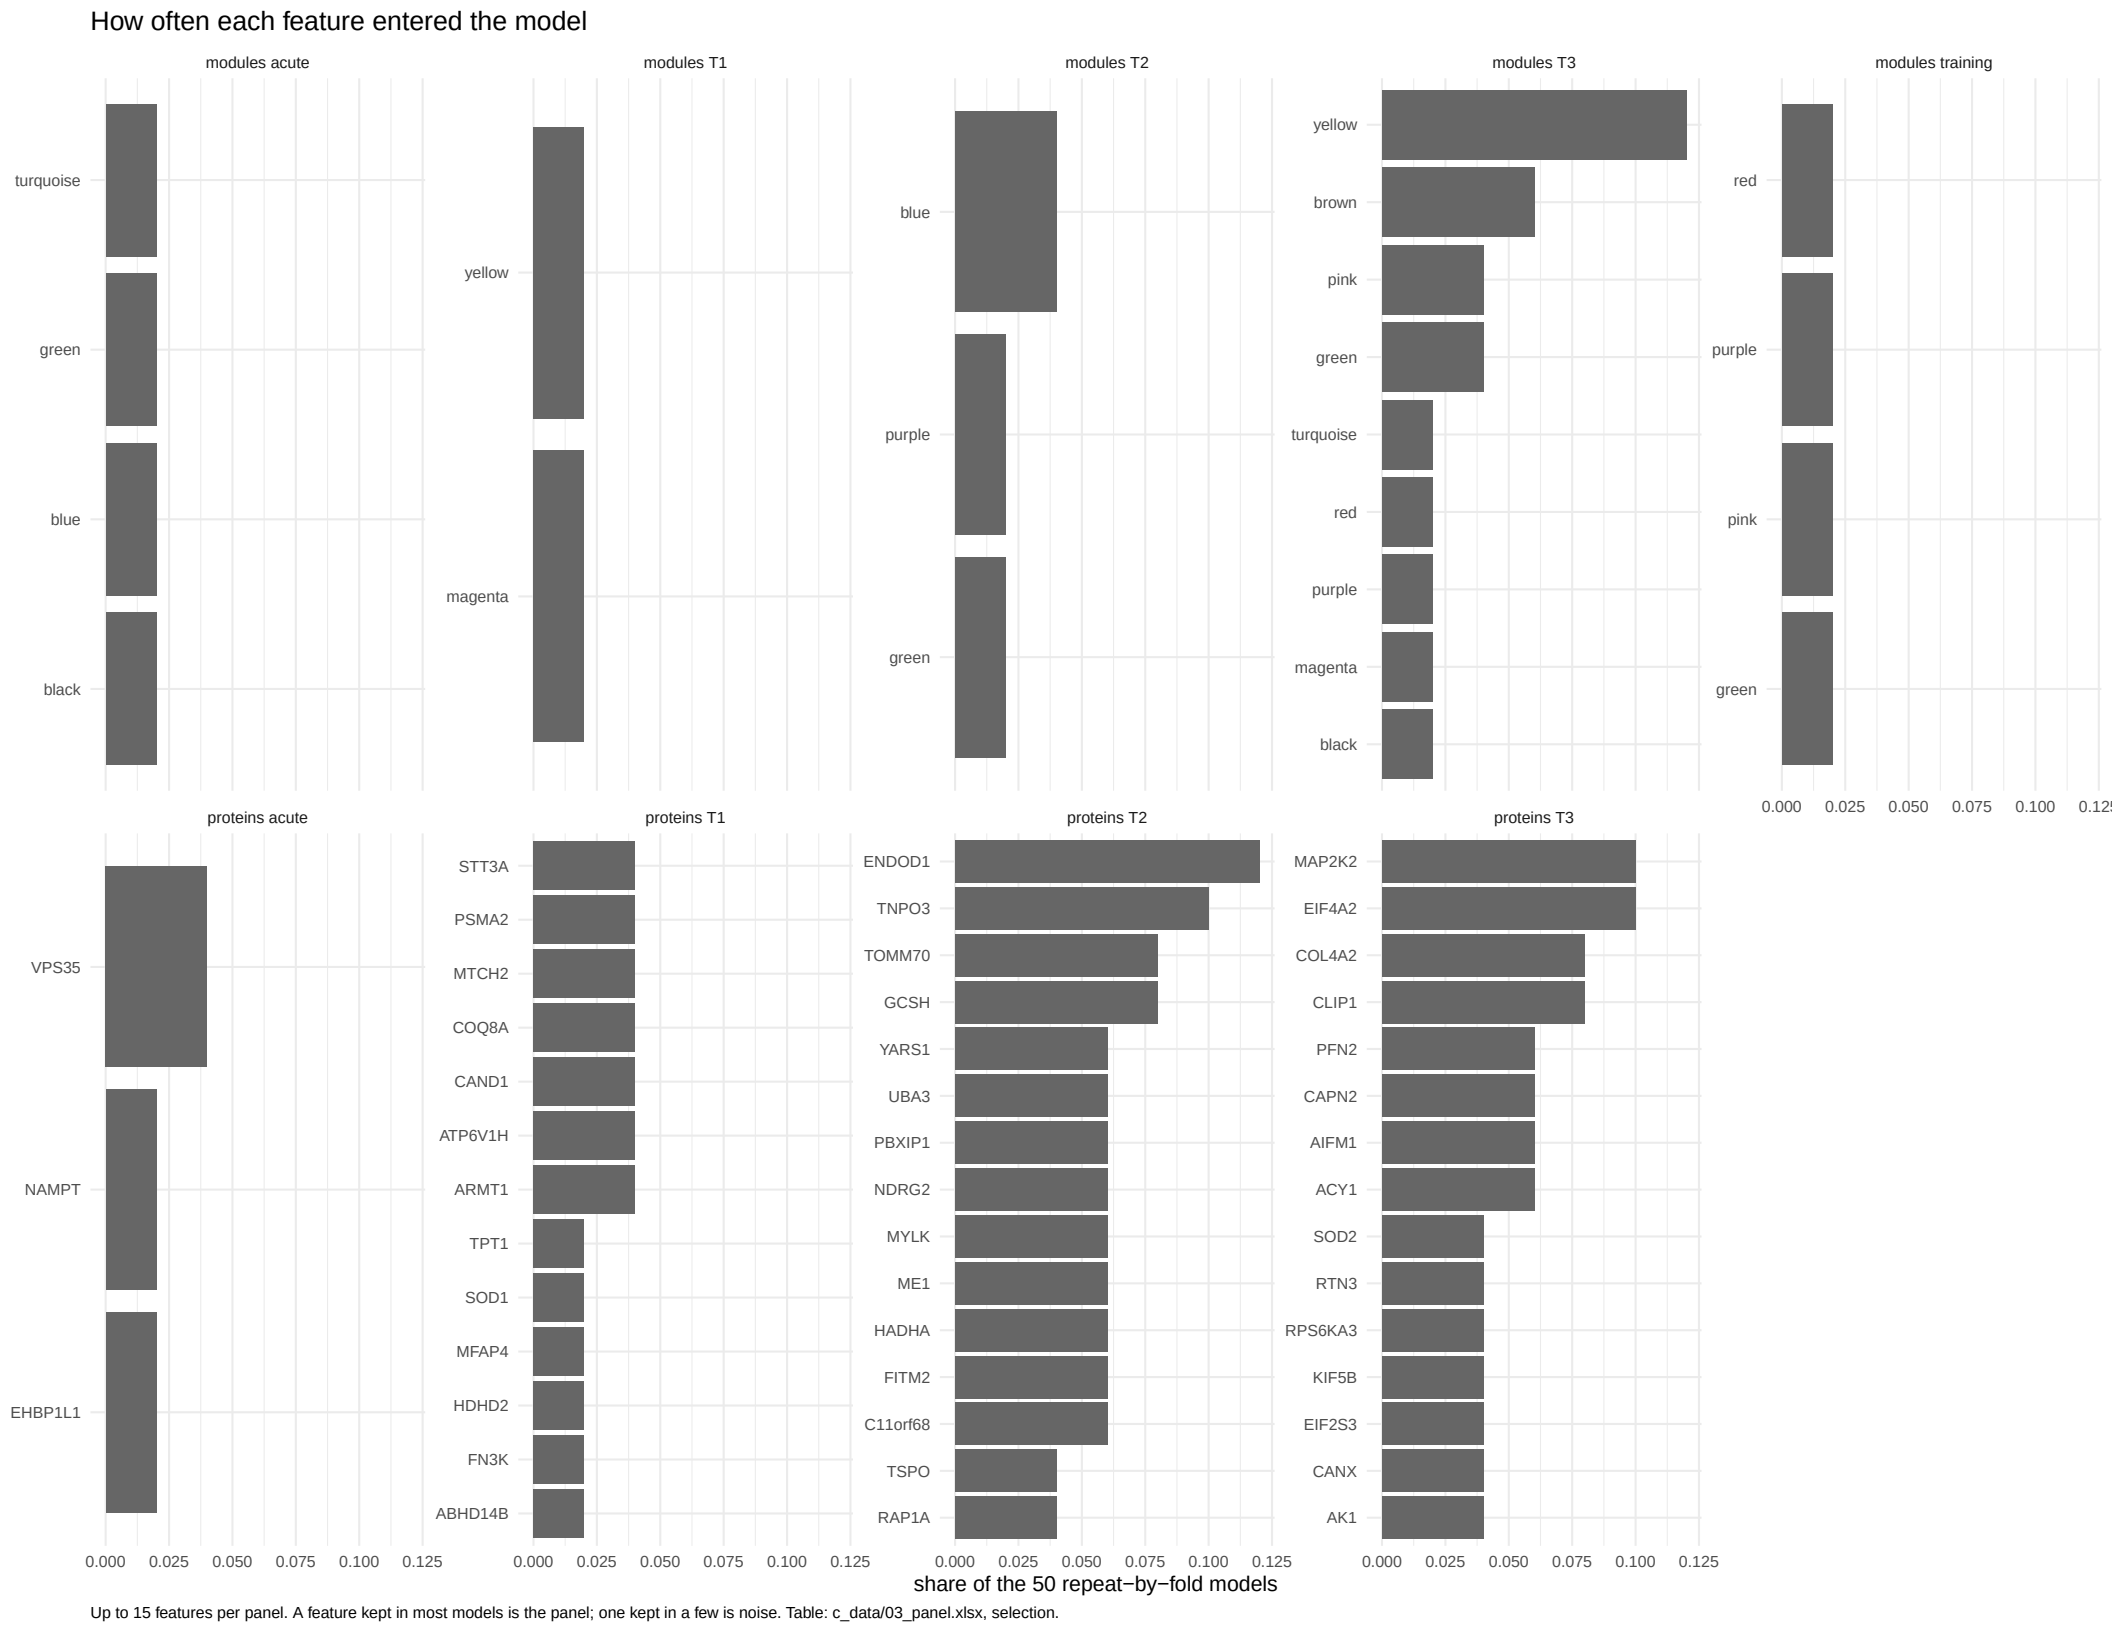
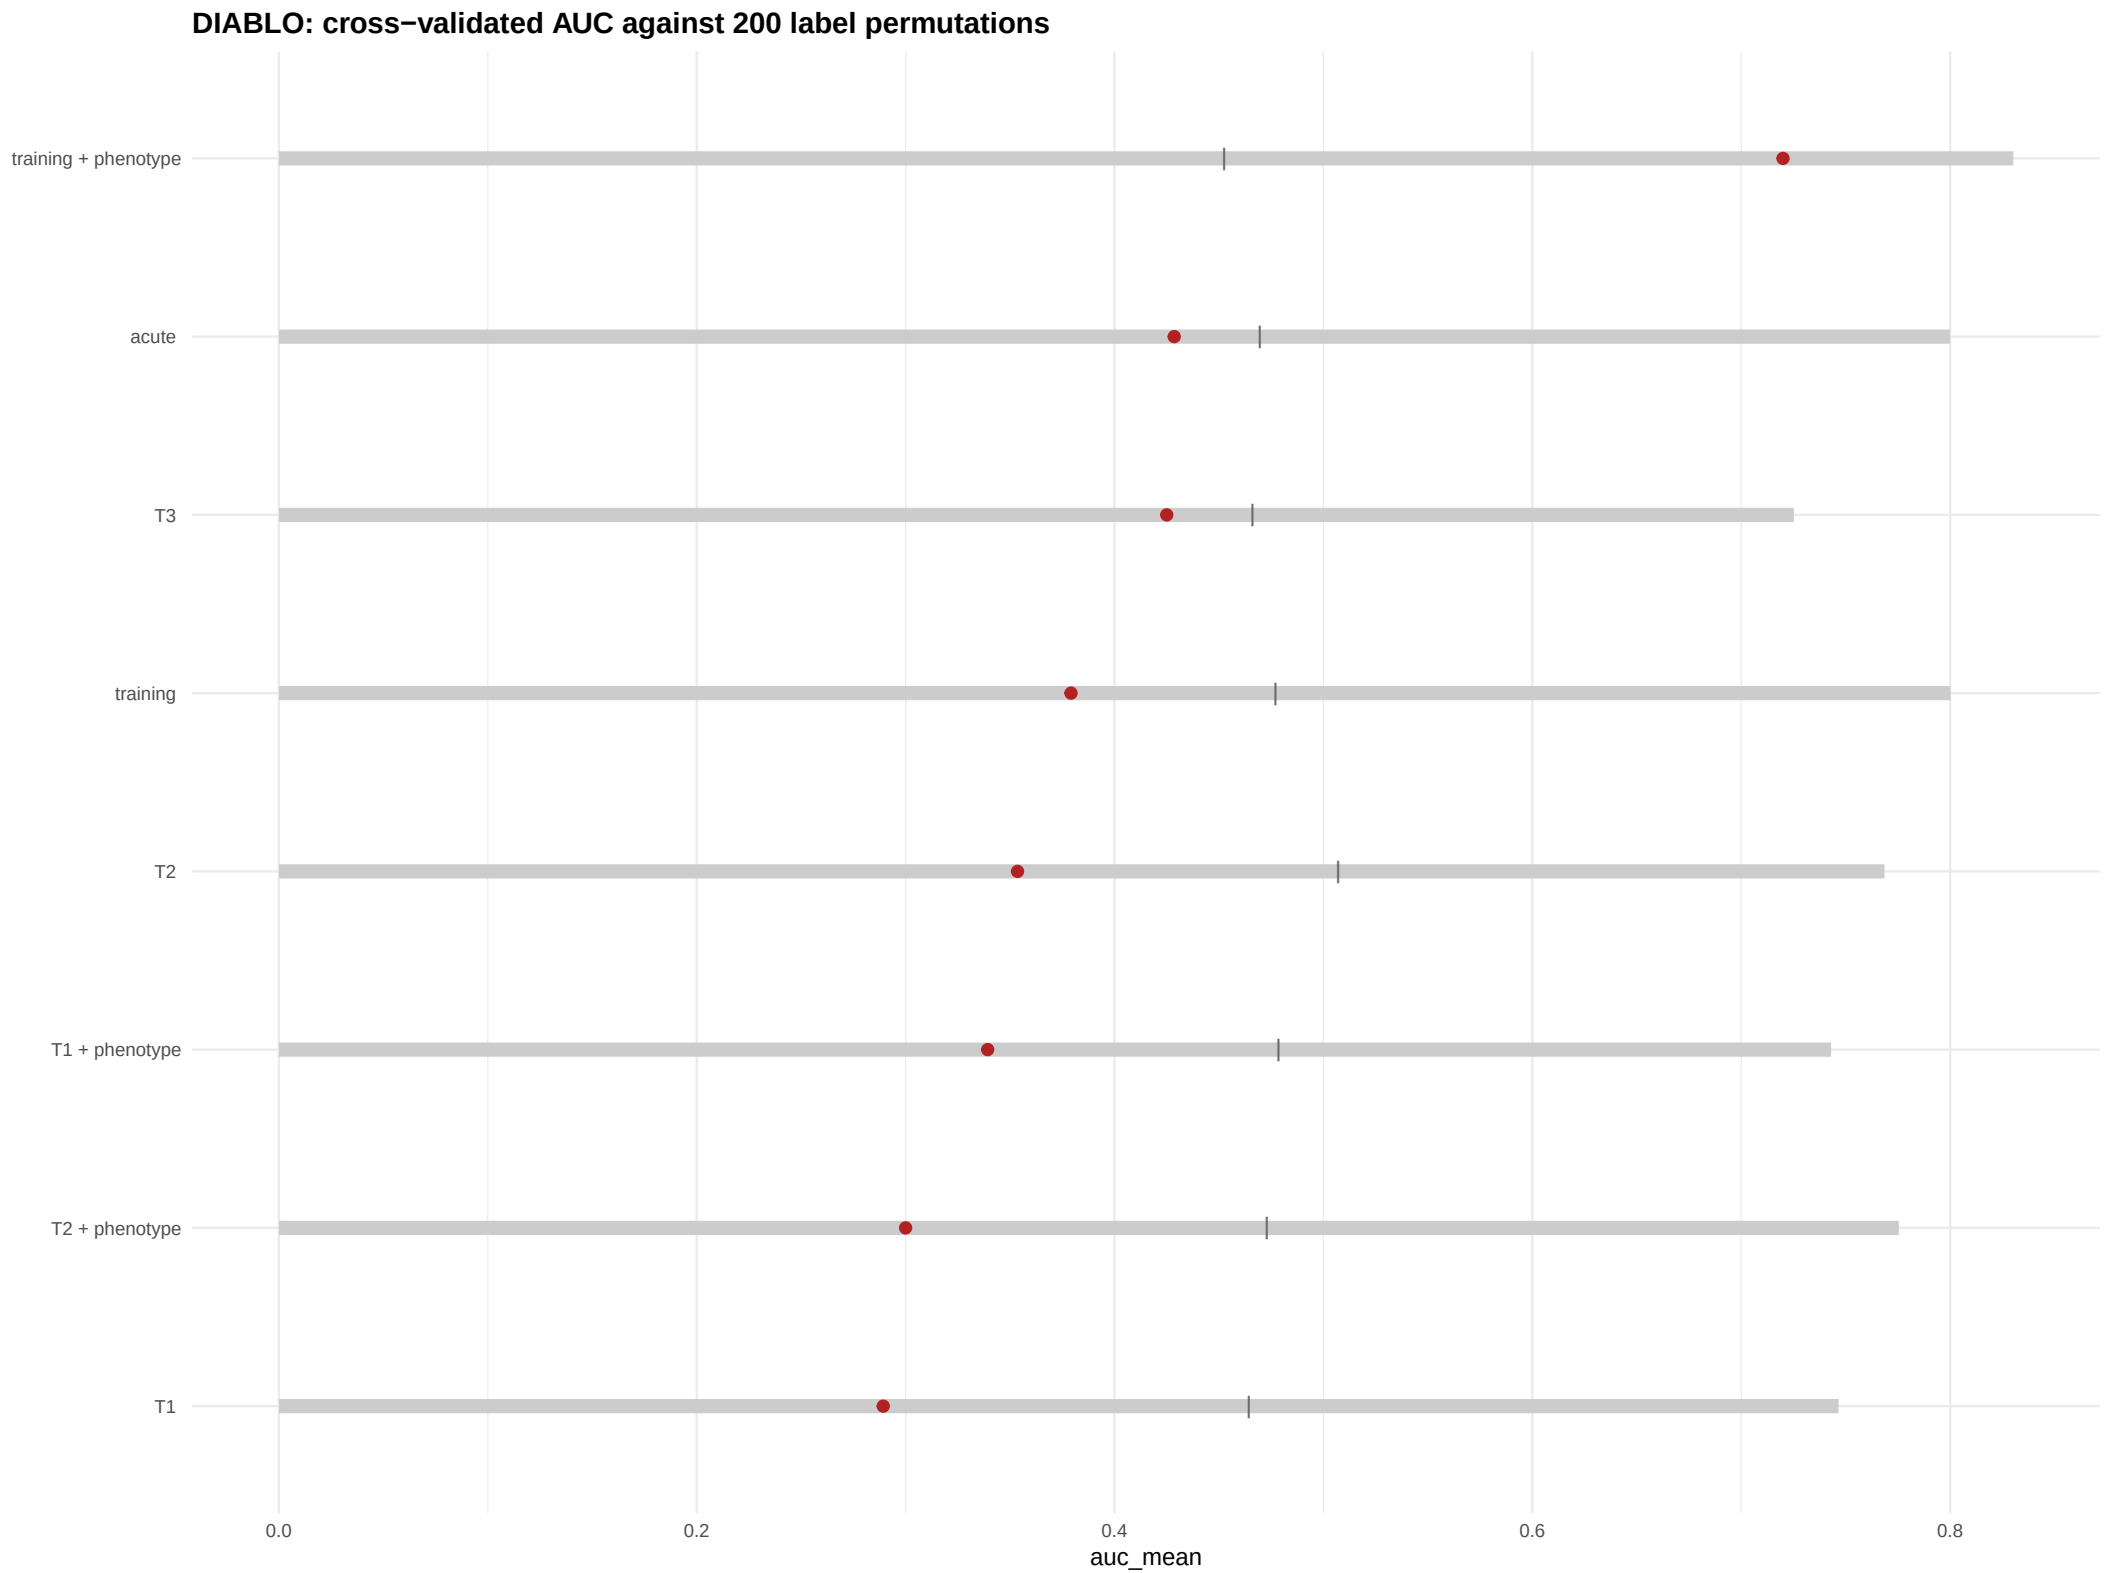
Elastic net (alpha 0.5, lambda.1se from inner leave−one−out) scored by 10 repeats of stratified 5−fold CV. Grey: mean AUC over the same pipeline with HR and LR labels shuffled, 1000 times; red: observed. p = (b + 1) / (m + 1). The null sits below 0.5: when a model keeps no feature its scores follow each training fold's class mix, so compare the red line with the grey, not with 0.5. Exploratory; no external validation. The module panels carry a leak: modules were built on all 16 subjects. Table: c_data/03_panel.xlsx, panels.



Up to 15 features per panel. A feature kept in most models is the panel; one kept in a few is noise. Table: c_data/03_panel.xlsx, selection.



Blocks: modules and proteins, with the phenotype block where marked. The training model with the phenotype block includes fibre−area change, which built the label, so its AUC is not a result. Table: c_data/03_panel.xlsx, diablo.
