Module preservation between arms

WGCNA modulePreservation, signed bicor, subject−centred, 200 permutations

Each point is a module built in one arm and tested in the other; the label gives its best−overlapping full−cohort module from 01_Build. Dashed lines mark Zsummary 2 and 10. A lower median rank means stronger preservation. Table: c_data/06_preserve.xlsx, preservation.

Top row: 50 random splits of the 16 subjects into halves of 8, arm ignored, modules built in one half and tested in the other (50 permutations each). Lower rows: the arm modules. Arm modules inside the random−halves range are as preserved as one population is with itself at this size. Table: c_data/06_preserve.xlsx, calibration.
