Module enrichment

clusterProfiler ORA, universe 1902 measured genes; top 3 sets per module at BH < 0.05

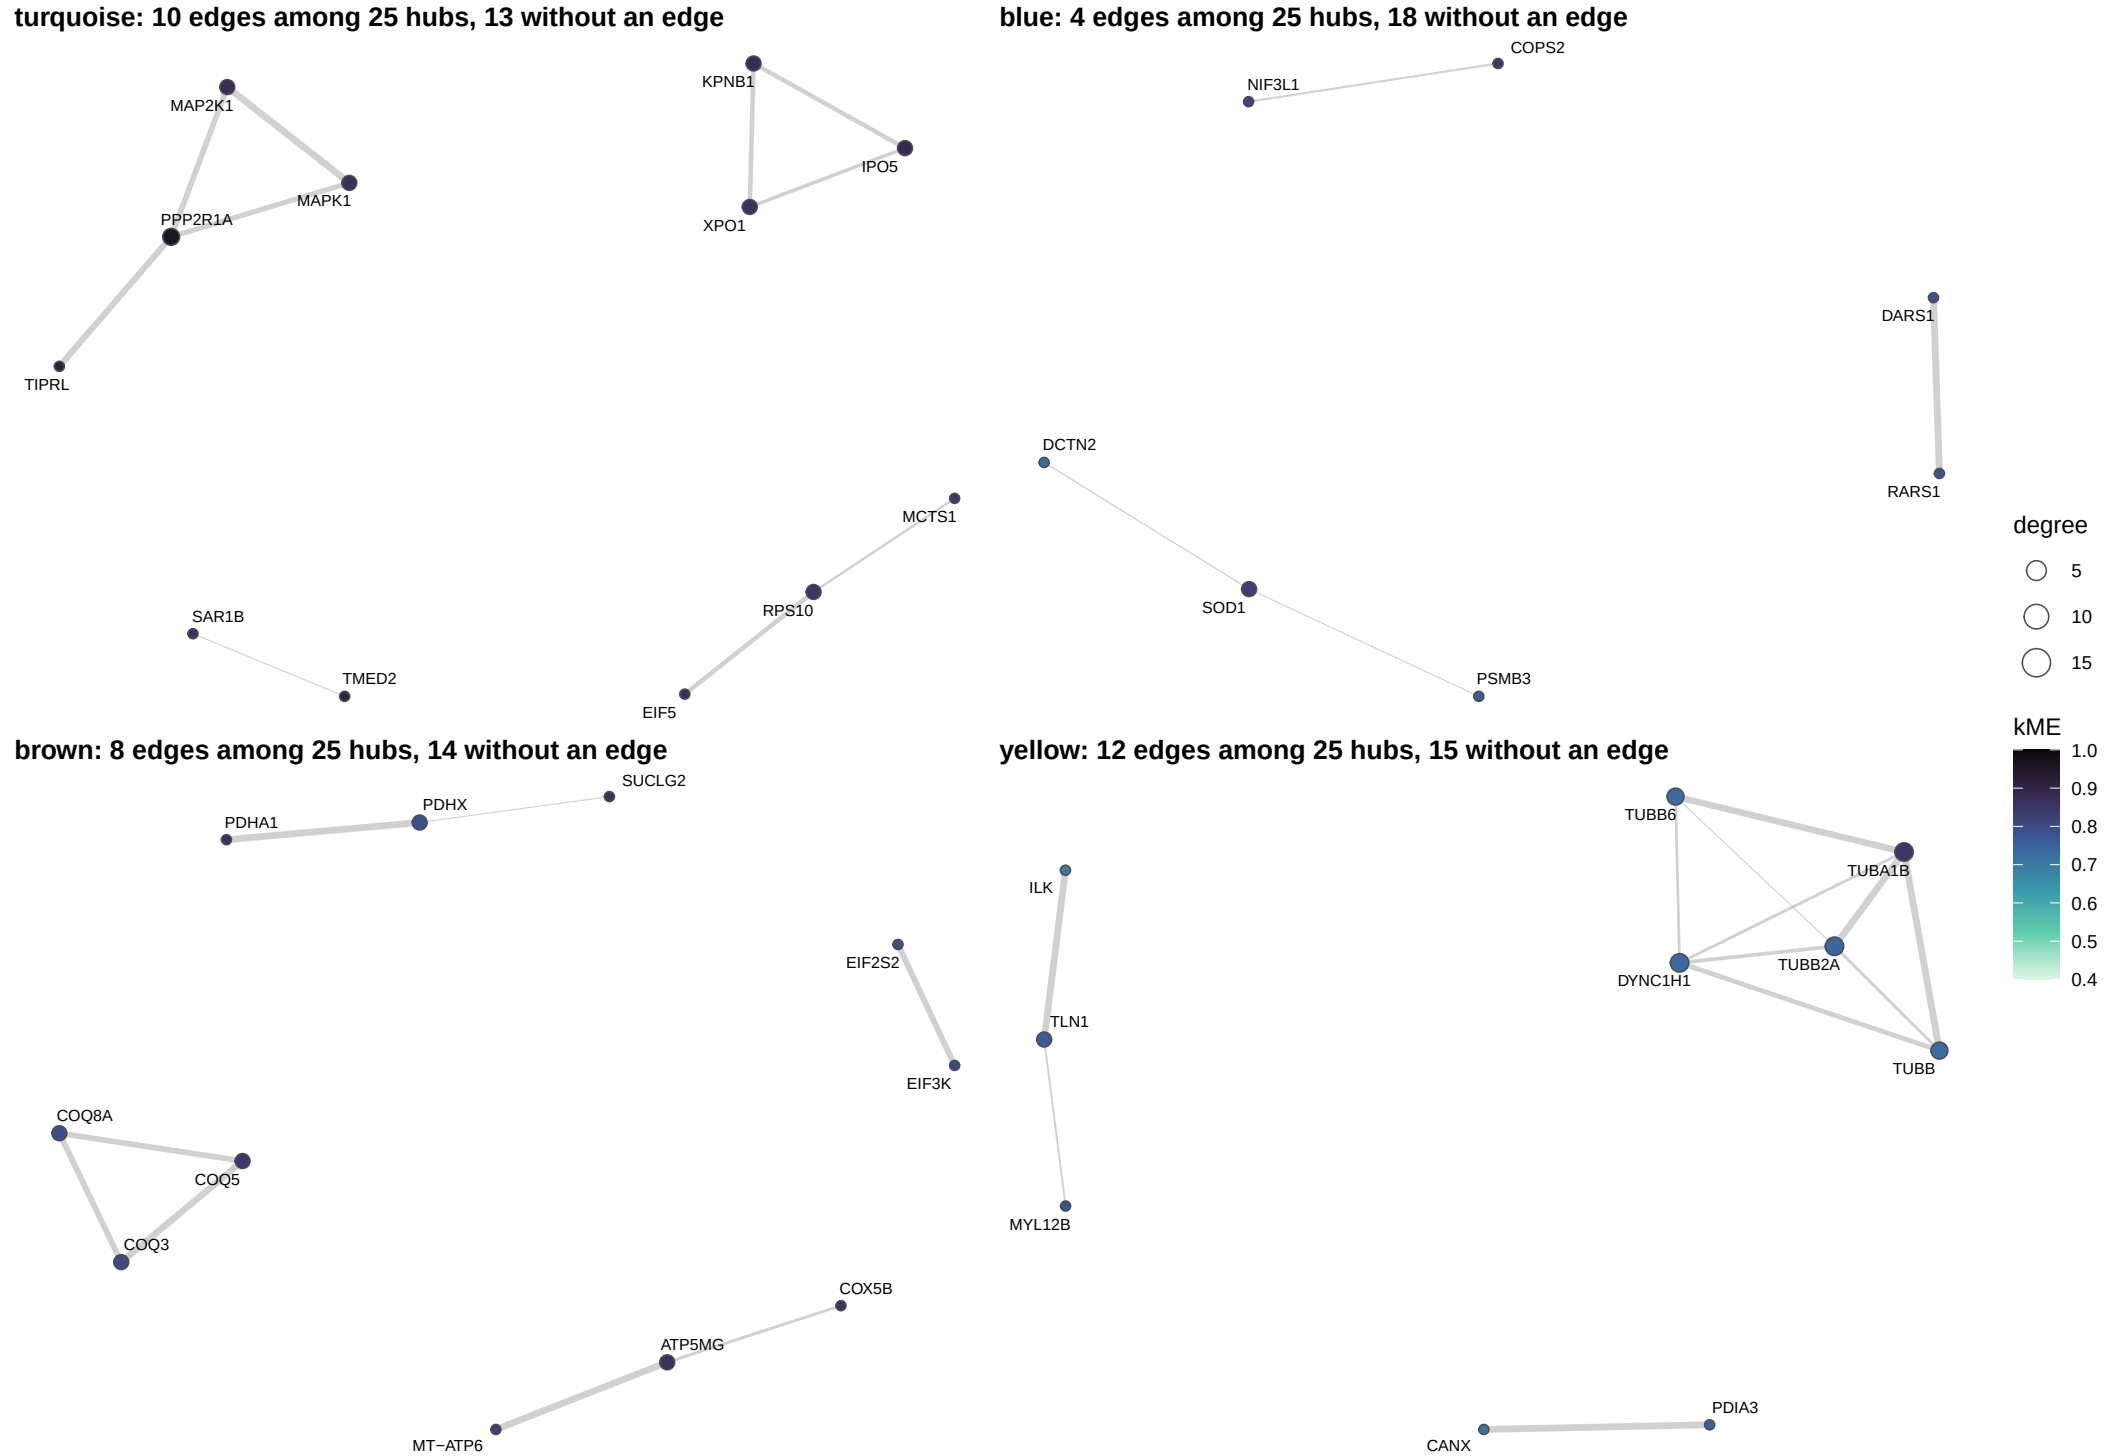

enrichplot::dotplot of the compareCluster result. Columns: modules, members carrying a set in brackets. Size is gene ratio, colour BH within module; modules with no set at BH < 0.05

within−module edges (log scale)
Point: observed high−confidence edges among a module's members. Tick: edges STRINGdb expects from the members' degrees in the background. Label: observed over expected. Table: c_data/05_characterise.xlsx, string.

Module hub networks

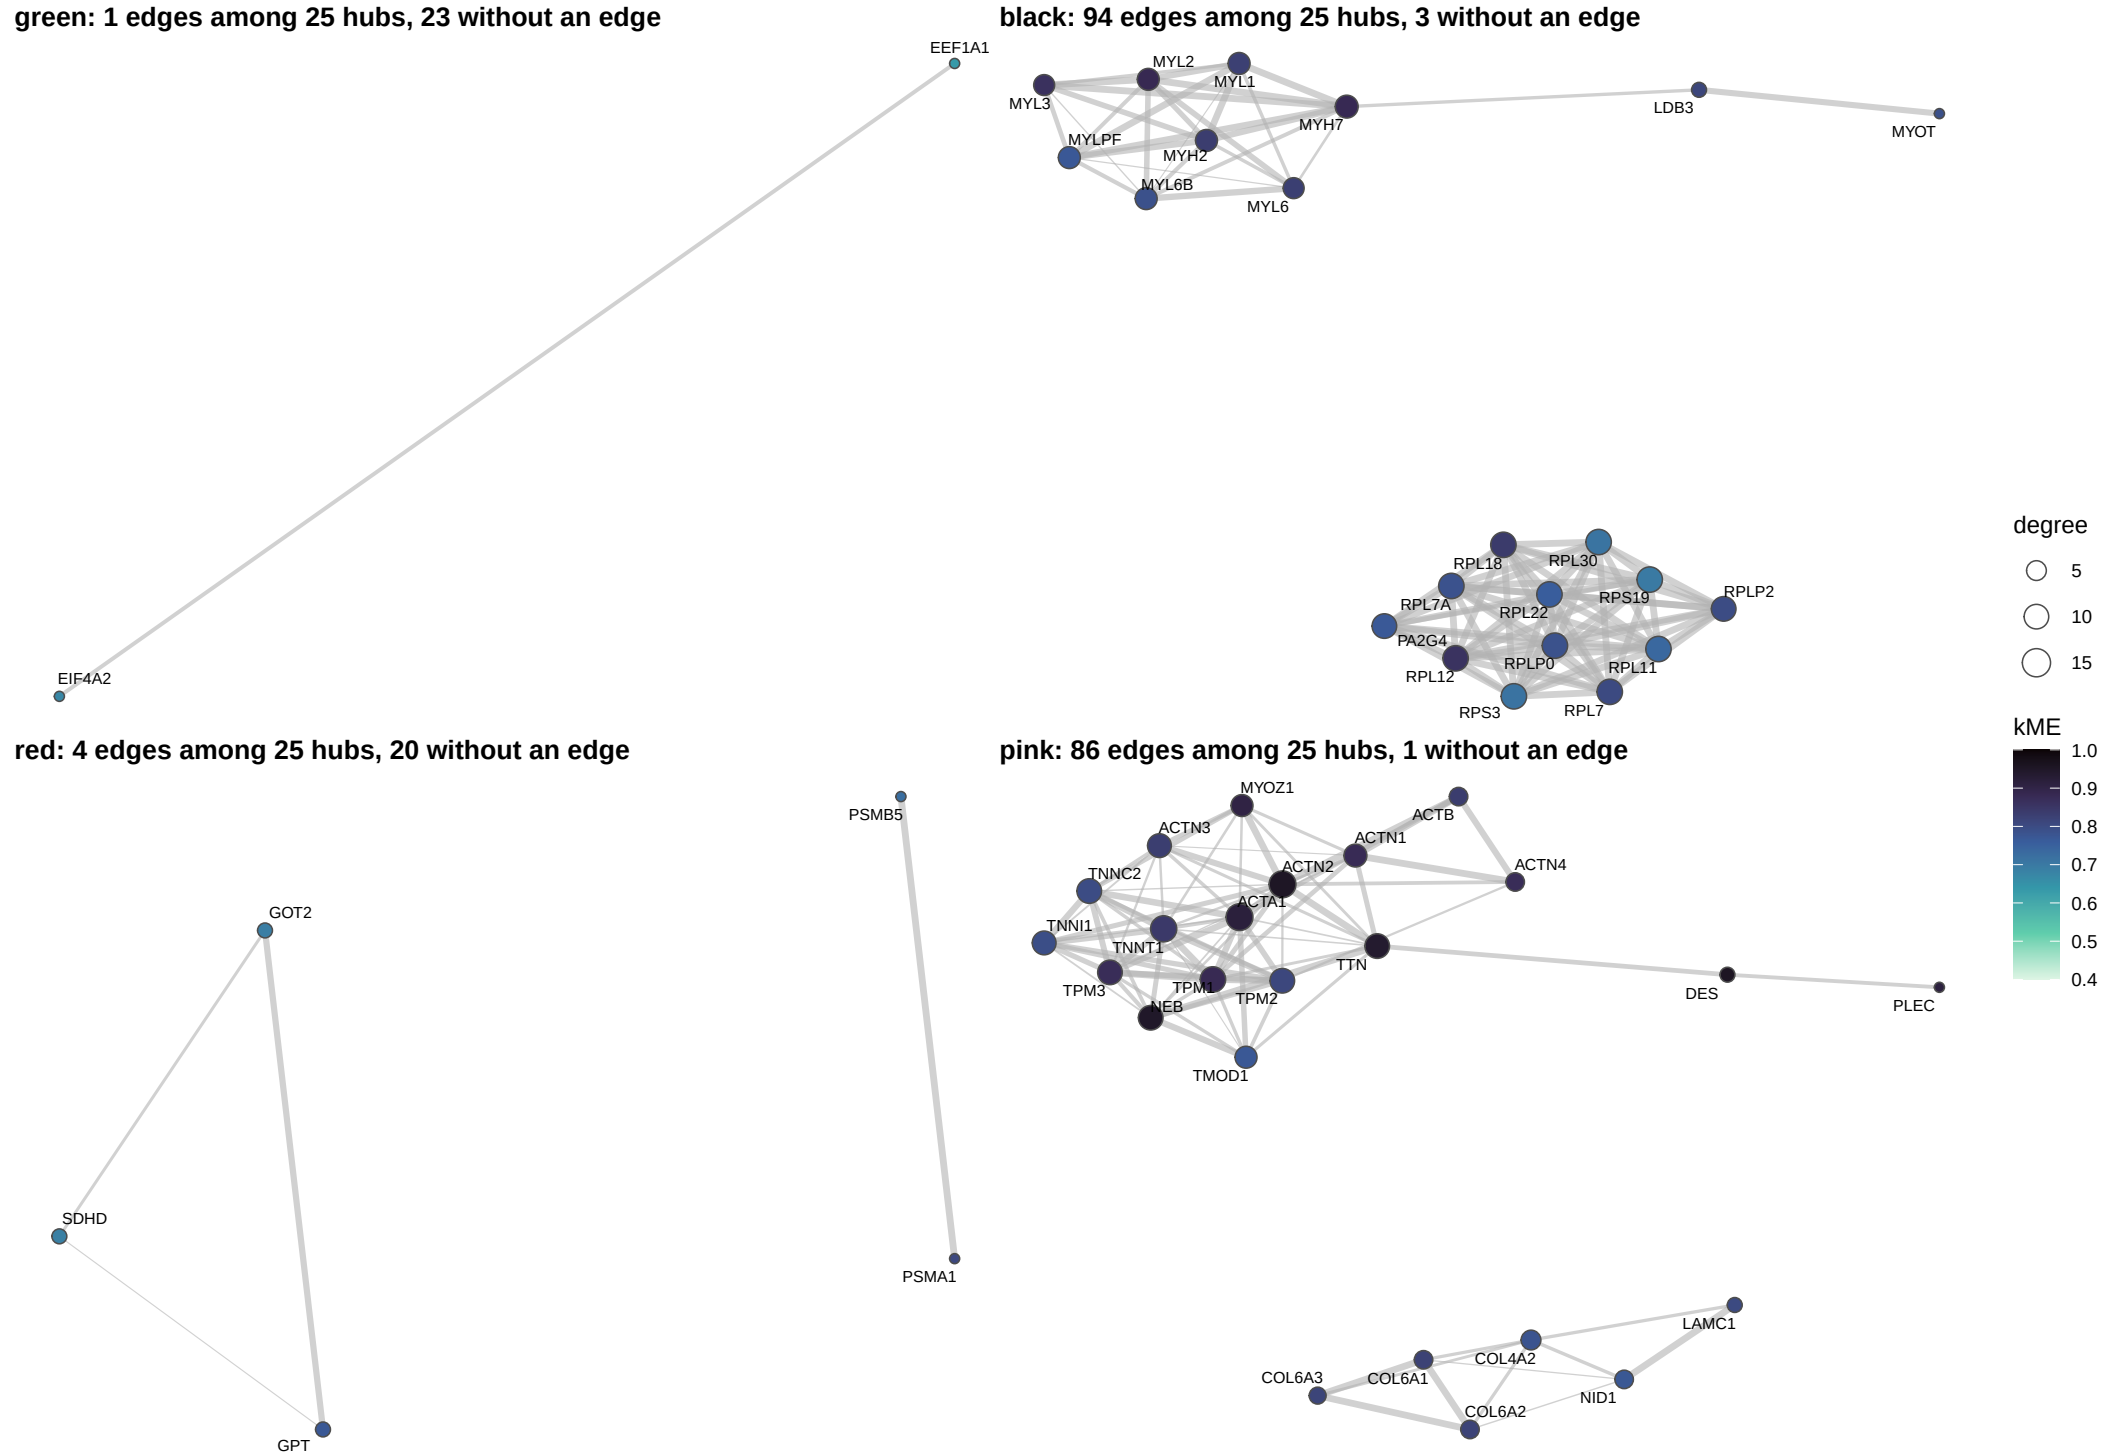

top 25 members by kME per module, STRING v12 edges at score >= 700; page 1 of 3

Nodes: a module's highest−kME members with at least one edge among them, fill = kME, size = degree among the drawn hubs; the title counts those without an edge. Edges: STRING combined score, width = score. Layout is force−directed and seeded; its geometry carries no meaning. Table: c_data/05_characterise.xlsx, hub_edges.

Module hub networks

top 25 members by kME per module, STRING v12 edges at score >= 700; page 2 of 3

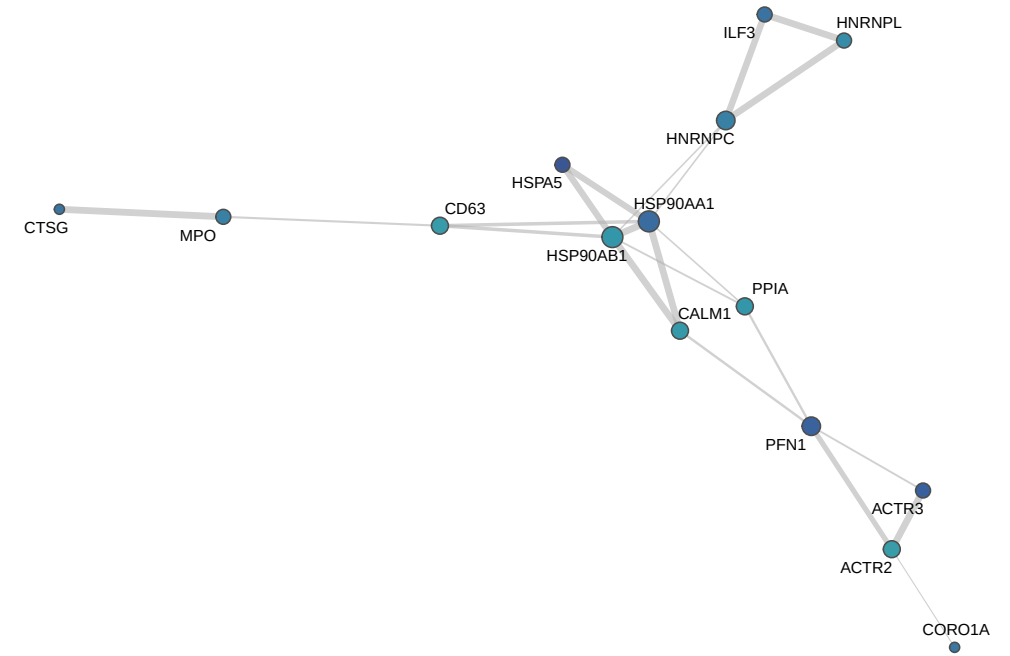

Nodes: a module's highest−kME members with at least one edge among them, fill = kME, size = degree among the drawn hubs; the title counts those without an edge. Edges: STRING combined score, width = score. Layout is force−directed and seeded; its geometry carries no meaning. Table: c_data/05_characterise.xlsx, hub_edges.

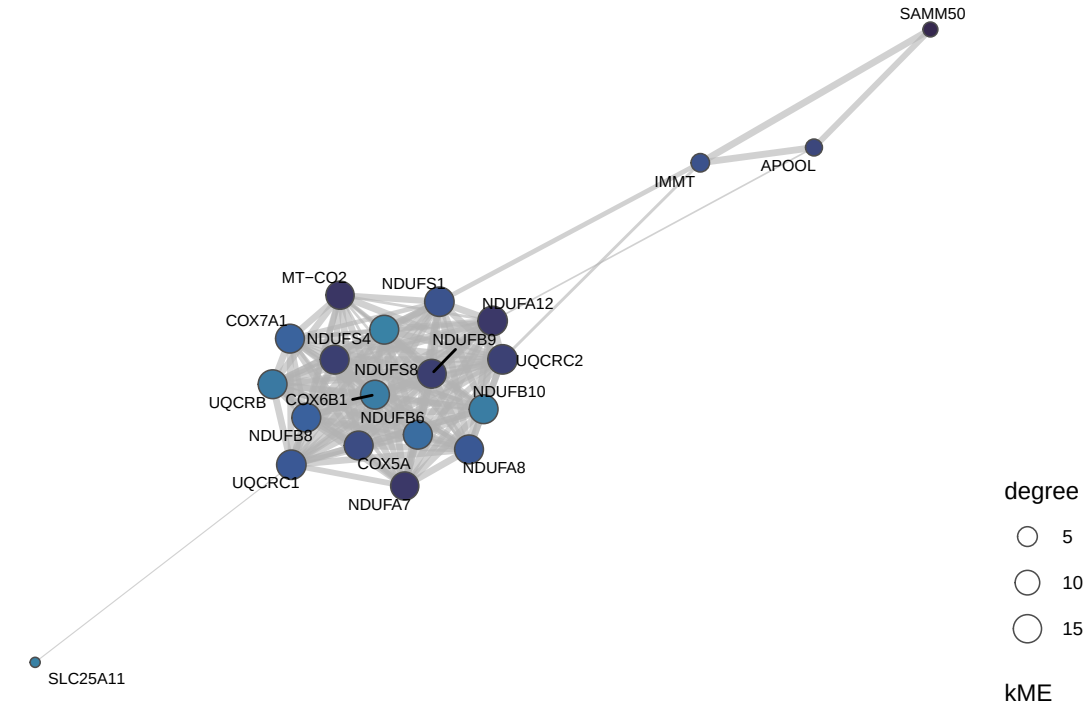

Module hub networks
