a Each person's training response

16 people, ordered by composite hypertrophy; grey: not measured

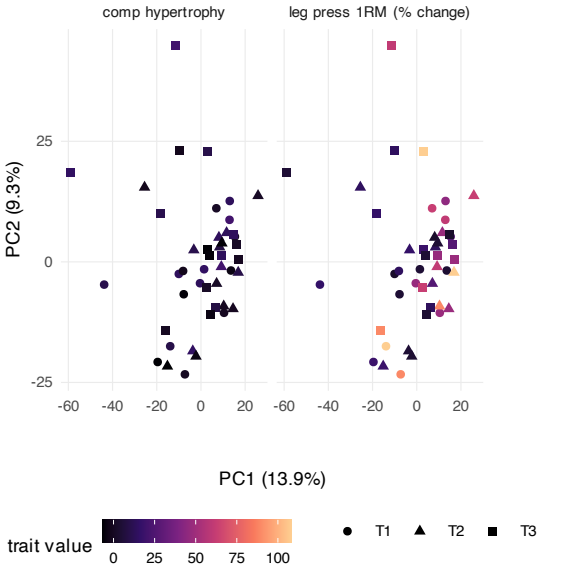

b How many features track each trait

Share of features at p < 0.05 (limma, one value per person); white: 5%, the share chance gives

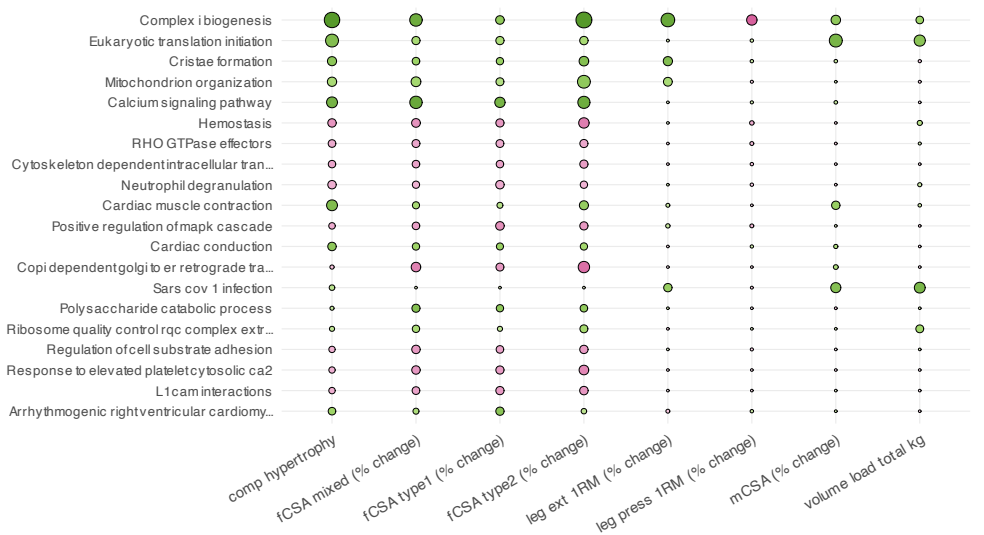

c Proteome by growth and strength gain

45 biopsies, 1,900 proteins

d Gene sets leading each trait's ranking, training window

fgsea on the limma t; sets at FDR < 0.05 for two or more traits, overlaps pruned

e Proteins that share a pattern of trait links

Profile groups (n proteins, main module): mean limma t per window and trait
