b How many features track each trait
Number: % of features at p < 0.05 (white: 5, chance); bold: count at FDR < 0.05
Level windows pair a time point's values with trait levels; the rest with % change

c Gene sets that follow the traits
fgsea on each window-trait protein ranking, everyone pooled; one set per tree cluster (Jaccard height 0.85, its most specific), up to 10 per window; * calls of opposite sign
Trait change, T1 to T2

Fatty acid catabolic process
Branched chain amino acid catabolism
IL2 STAT5 signaling
Acyl CoA metabolic process
Adipocytokine signaling pathway
Regulation of carbohydrate metabolic process
Eph ephrin signaling
Cell substrate junction organization
Homotypic cell cell adhesion
Positive regulation of tumor necrosis factor superfamily cyto...
Carboxylic acid transmembrane transport
Semaphorin interactions
Aerobic respiration and respiratory electron transport
Platelet aggregation
Ion transport by p type ATPases
Coagulation
Cardiac muscle contraction
Acetyl CoA biosynthetic process
Epithelial mesenchymal transition
Maturation of denv proteins
Aerobic respiration and respiratory electron transport
Citrate cycle TCA cycle
Cristae formation
Complex IV assembly
Acetyl CoA biosynthetic process
Regulation of intracellular transport
Mitochondrial protein degradation
Mitochondrial transport
Cardiac muscle contraction
Establishment of organelle localization
Hedgehog ligand biogenesis
Regulation of DNA biosynthetic process
Formation of tubulin folding intermediates by cctric
Lipid homeostasis
Regulation of response to wounding
Regulation of establishment of protein localization to mitoch...
ECM receptor interaction
Positive regulation of protein localization to cell periphery
Heart morphogenesis
Oxidative phosphorylation
Epigenetic regulation of gene expression
Lipid oxidation
Aerobic respiration and respiratory electron transport
Cellular senescence
Striated muscle adaptation
Golgi vesicle transport
Polysaccharide catabolic process
Tricarboxylic acid cycle
Mitochondrion organization
Long chain fatty acid transport
Epigenetic regulation of gene expression
Ribosome
RHO GTPases activate PKNs
Muscle cell differentiation
Glycogen metabolism
Cellular response to molecule of bacterial origin
Electron transport chain
Receptor internalization
Cellular senescence
Actin myosin filament sliding
