

A

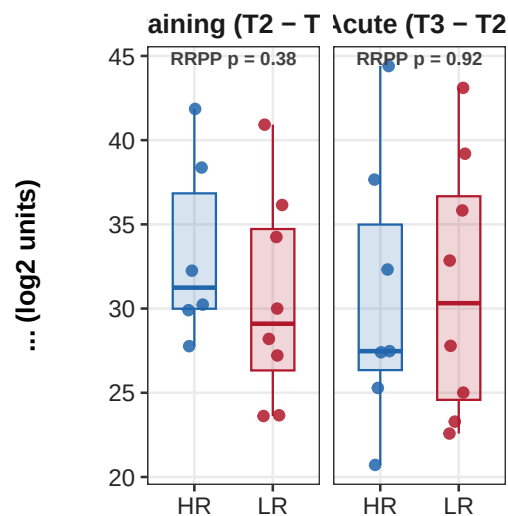

Global Proteome State

PCA – no detectable group separation (PERMANOVA $p = 0.62$)

B

Response Magnitude ...

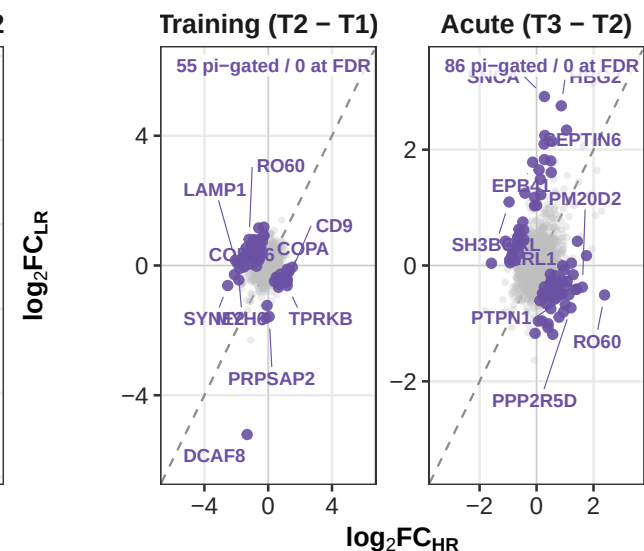

RRPP – no detectable magnitude difference

C

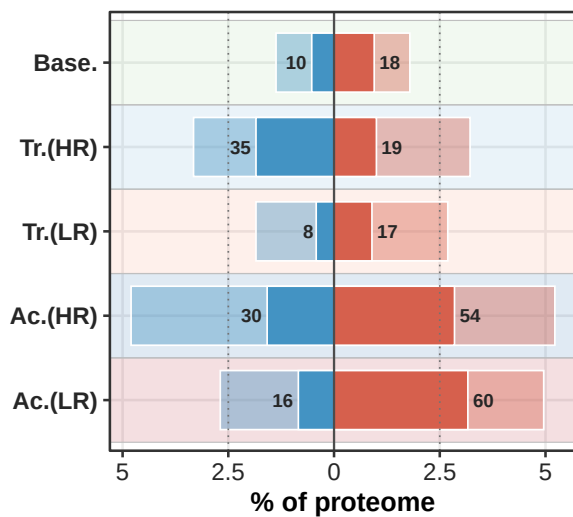

Protein-level divergence leads

pi-gated candidates; none survive FDR (exploratory)

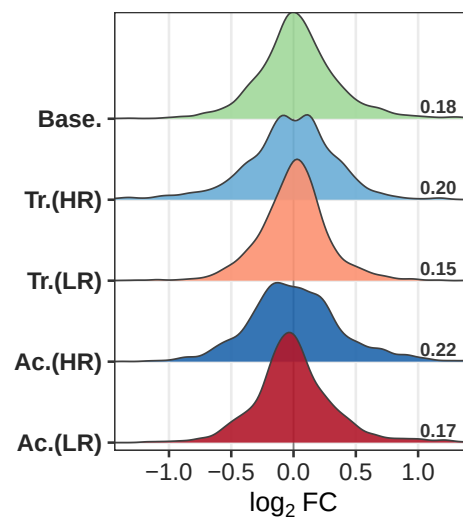

D

DEPs per Contrast

% of proteome (light = nominal p , dark = pi); dotted = chance

E

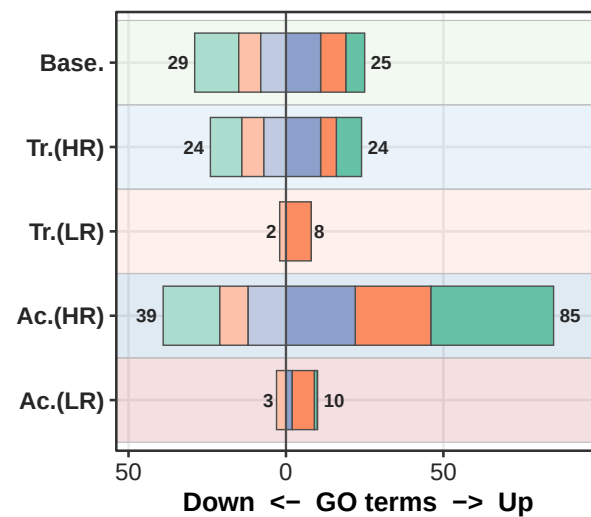

Effect-Size Distribution

logFC density per contrast; number = median $|\log_2 FC|$ 

F

Pathway Enrichment (GO)

non-redundant sets, BH < 0.05
