a Does a feature follow a trait differently in HR and LR?

HR slope minus LR slope (limma, feature ~ group x trait). Number: % of features at p < 0.05 (white: 5, chance); bold below: count at FDR < 0.05. The composite score defined the groups and is left out

b The strongest screen, within each group

leg press 1RM (% change), T2 - T1, 1,422 set scores; 44 of 44 FDR hits change sign

c Cardiac muscle tissue morphogenesis, person by person

HR slope minus LR slope: t = -9.4, p < 0.001, FDR < 0.001
