

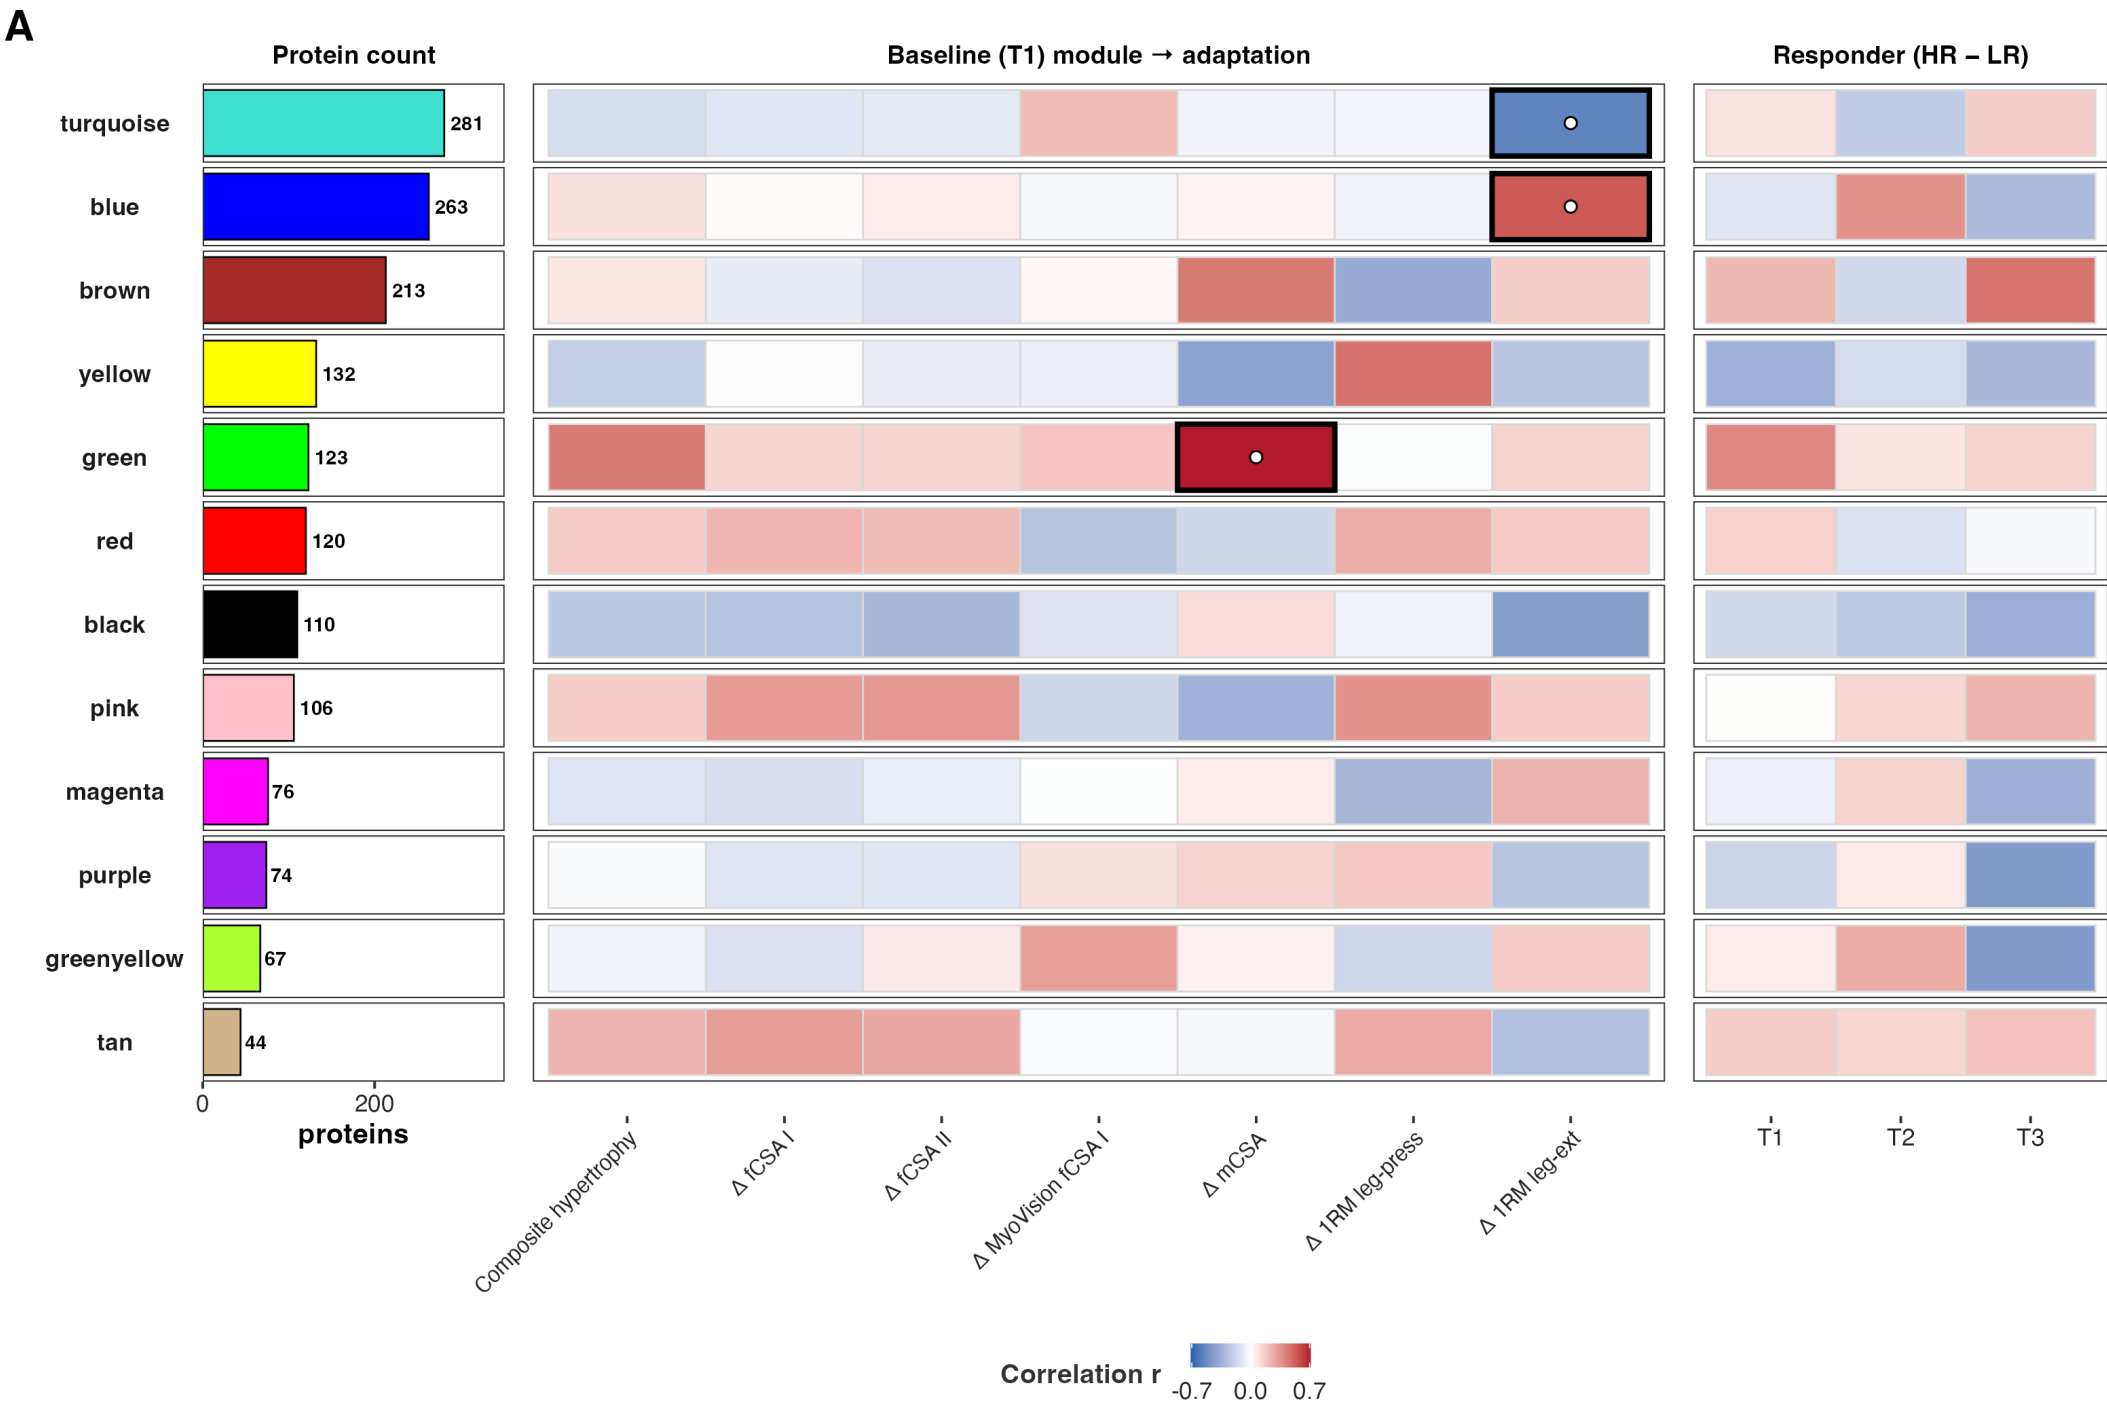

Figure 6. Co-expression module atlas and phenotype links

Unsupervised WGCNA modules, their enriched biology, and how each module's response tracks the phenotype.

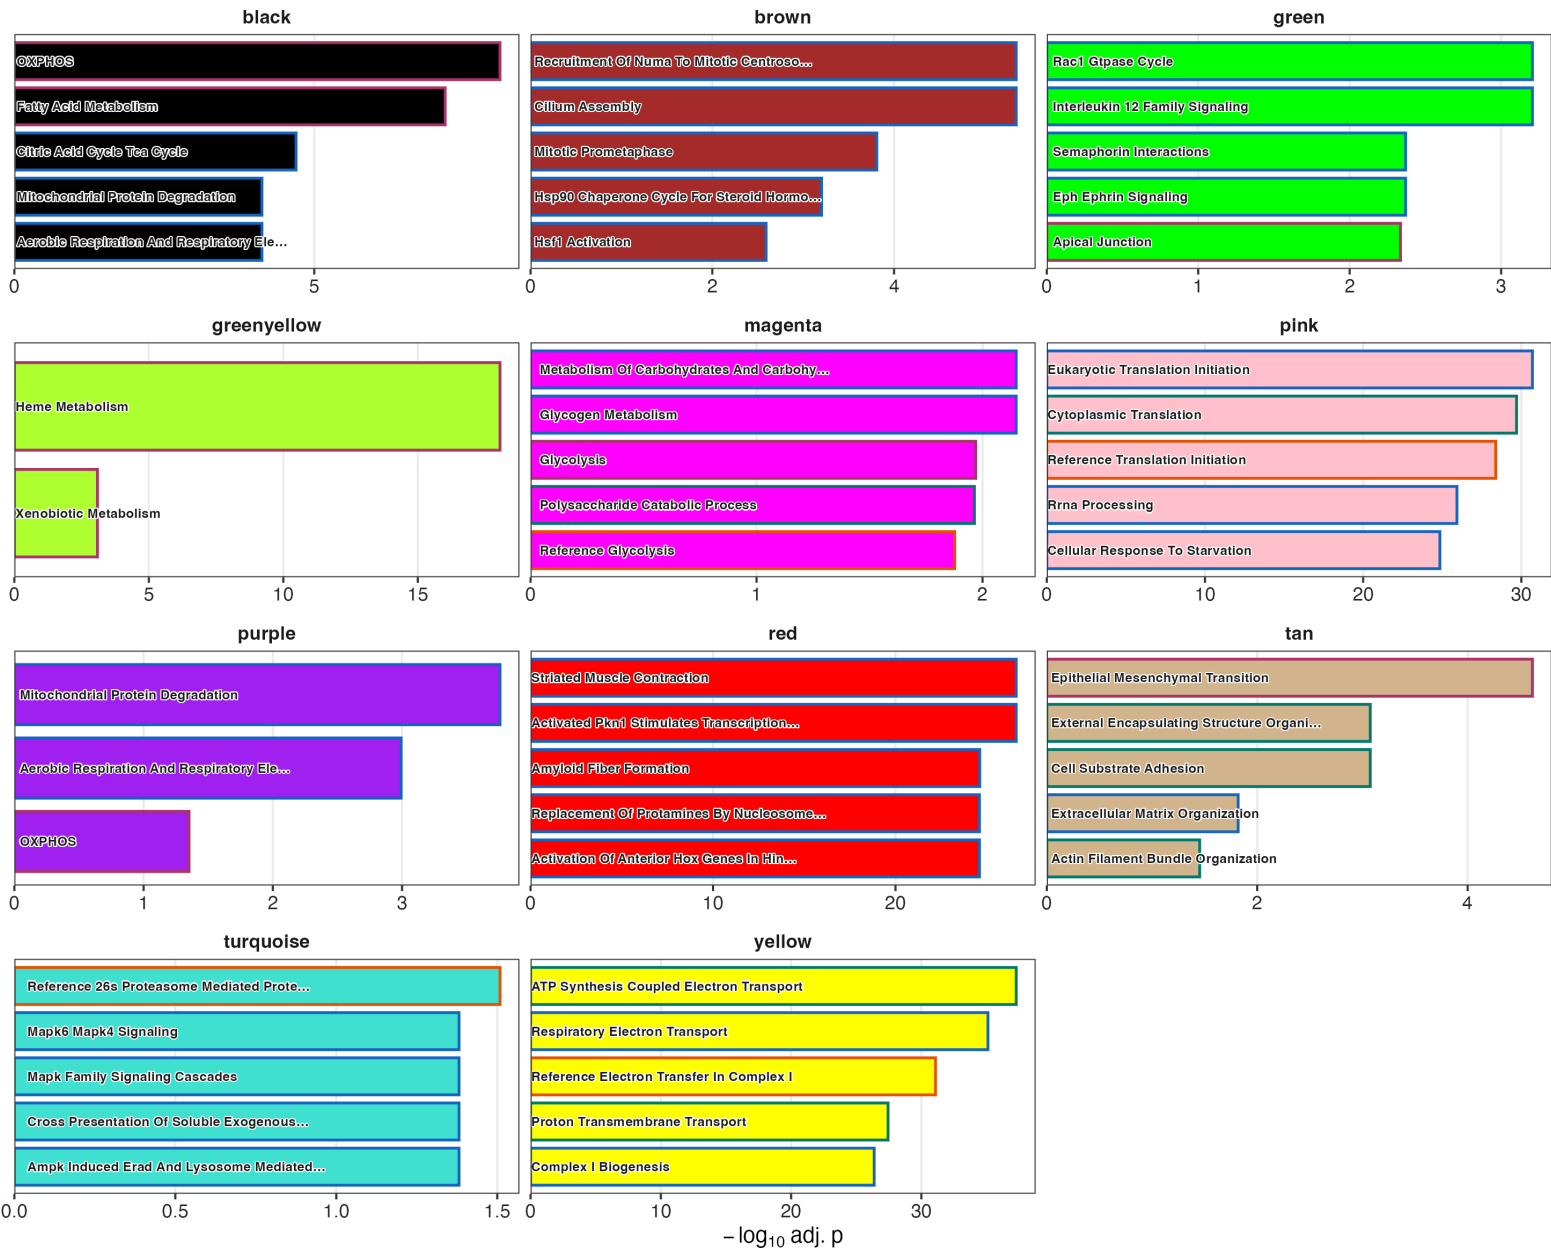

WGCNA module atlas: size, baseline association with adaptation, and responder signal

Full-proteome signed network: 1609 proteins in 12 modules (rows ordered by module size). Middle: correlation of each module's baseline (T1) eigengene with each training adaptation (Δ T1 $\rightarrow$ T2); white dot = positive leave-one-out Q^2 (within-cohort cross-validation), bold = $p<0.05$, * = FDR<0.05. Right: module-responder (HR-LR) correlation per timepoint.

B Module biology: pathway over-representation by WGCNA module

Hypergeometric ORA with Jaccard de-duplication against the full measured proteome (1922 proteins); top 5 pathways per module, adj. $p < 0.05$. Bar = module colour, outline = source database.

C

Module response vs phenotype

Eigengene change (T1 $\rightarrow$ T3) vs trait; r if $p<0.05$, * = FDR<0.05
