NES concordance, all collections: Training_HR against Training_LR

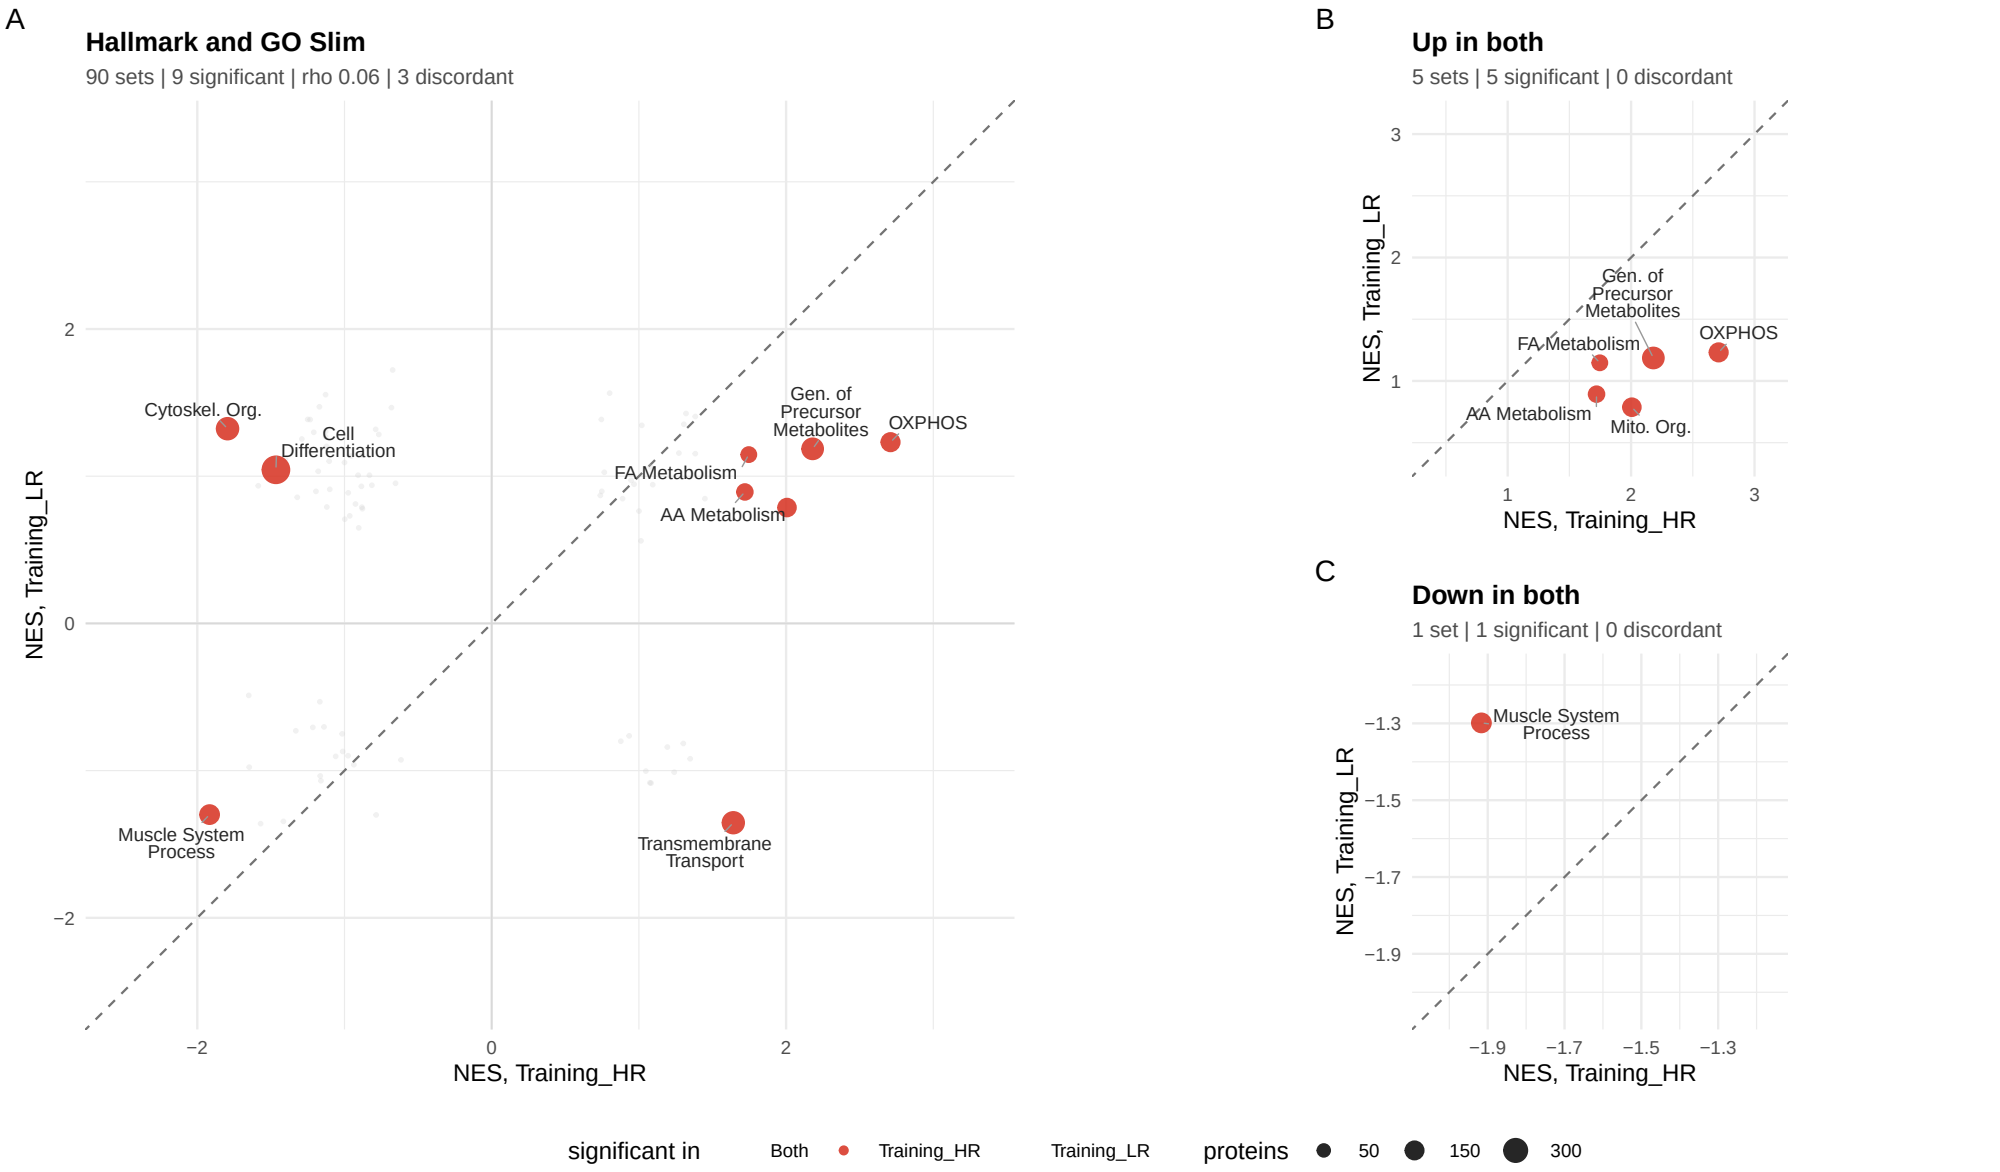

fgsea NES per contrast, 1369 sets, BH within contrast

One point per gene set, scored in both training contrasts. Dashed line is identity; grey points reach neither threshold. Discordant sets are significant in at least one arm and sit on opposite sides of zero. Panel C rescales the

NES concordance, Hallmark and GO Slim: Training_HR against Training_LR

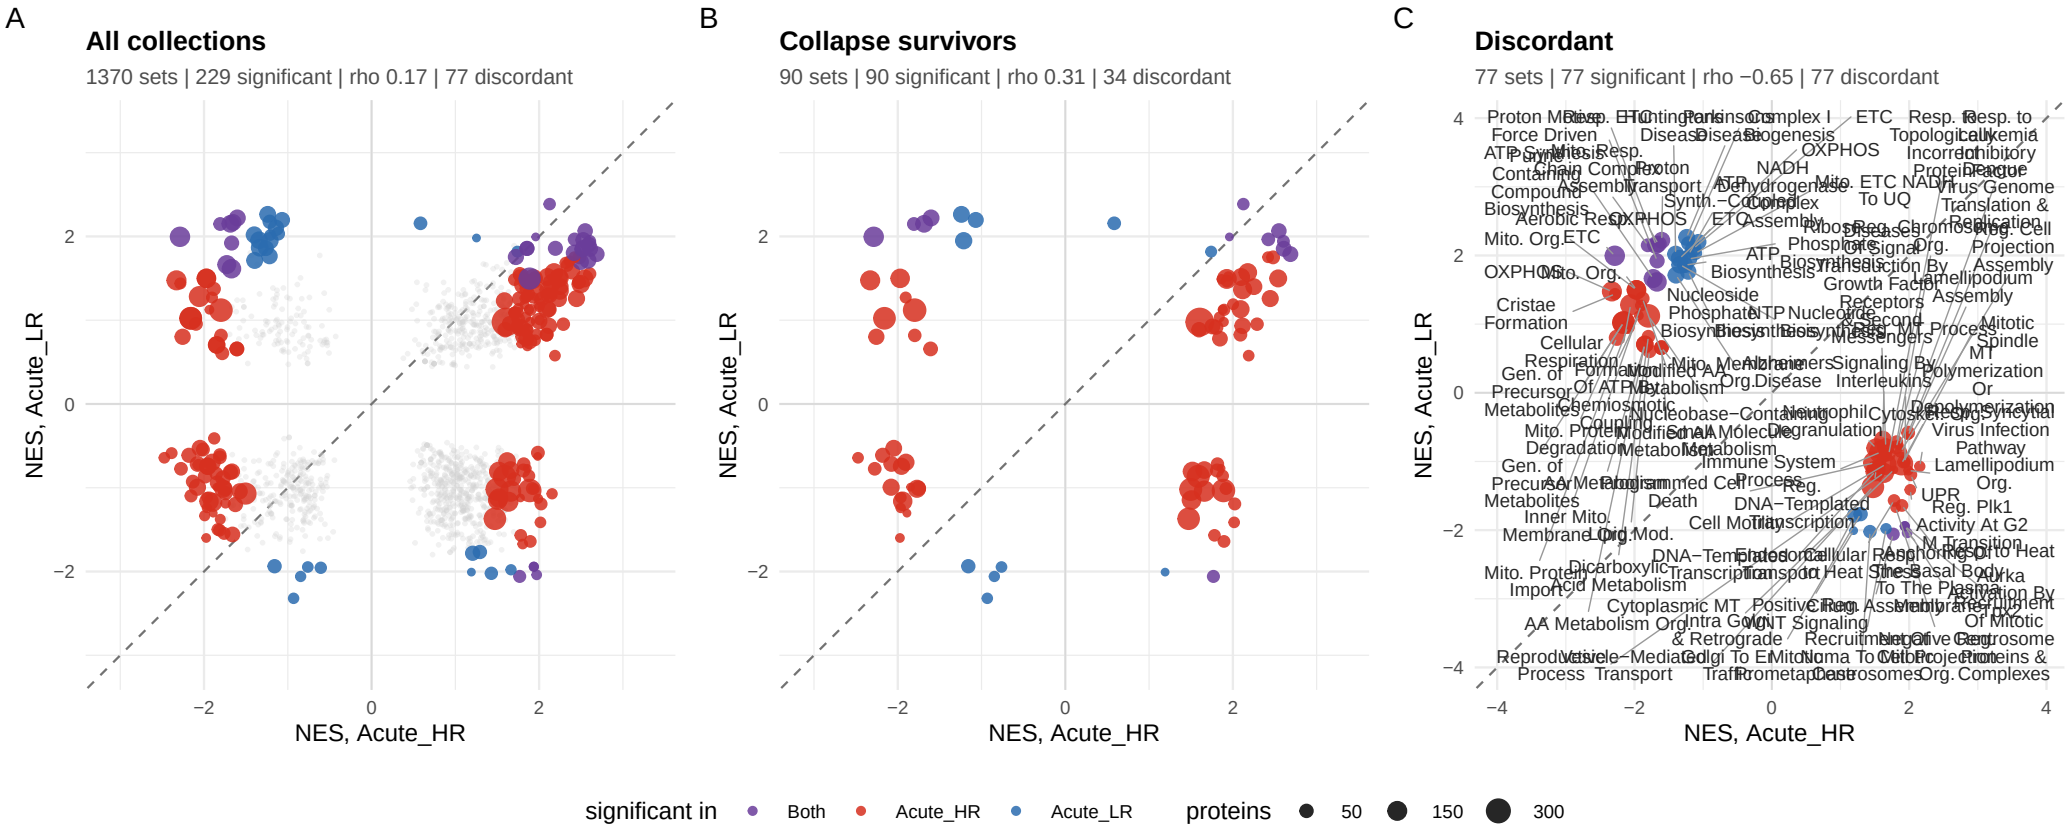

fgsea NES per contrast, 90 non−nesting sets, BH within contrast

Panel A is every Hallmark and GO Slim set; B and C rescale the significant sets with the same sign in both arms, so each can be named. Point size is protein count, colour the contrast a set reached FDR 0.05 in. Table: c_d

NES concordance, all collections: Acute_HR against Acute_LR

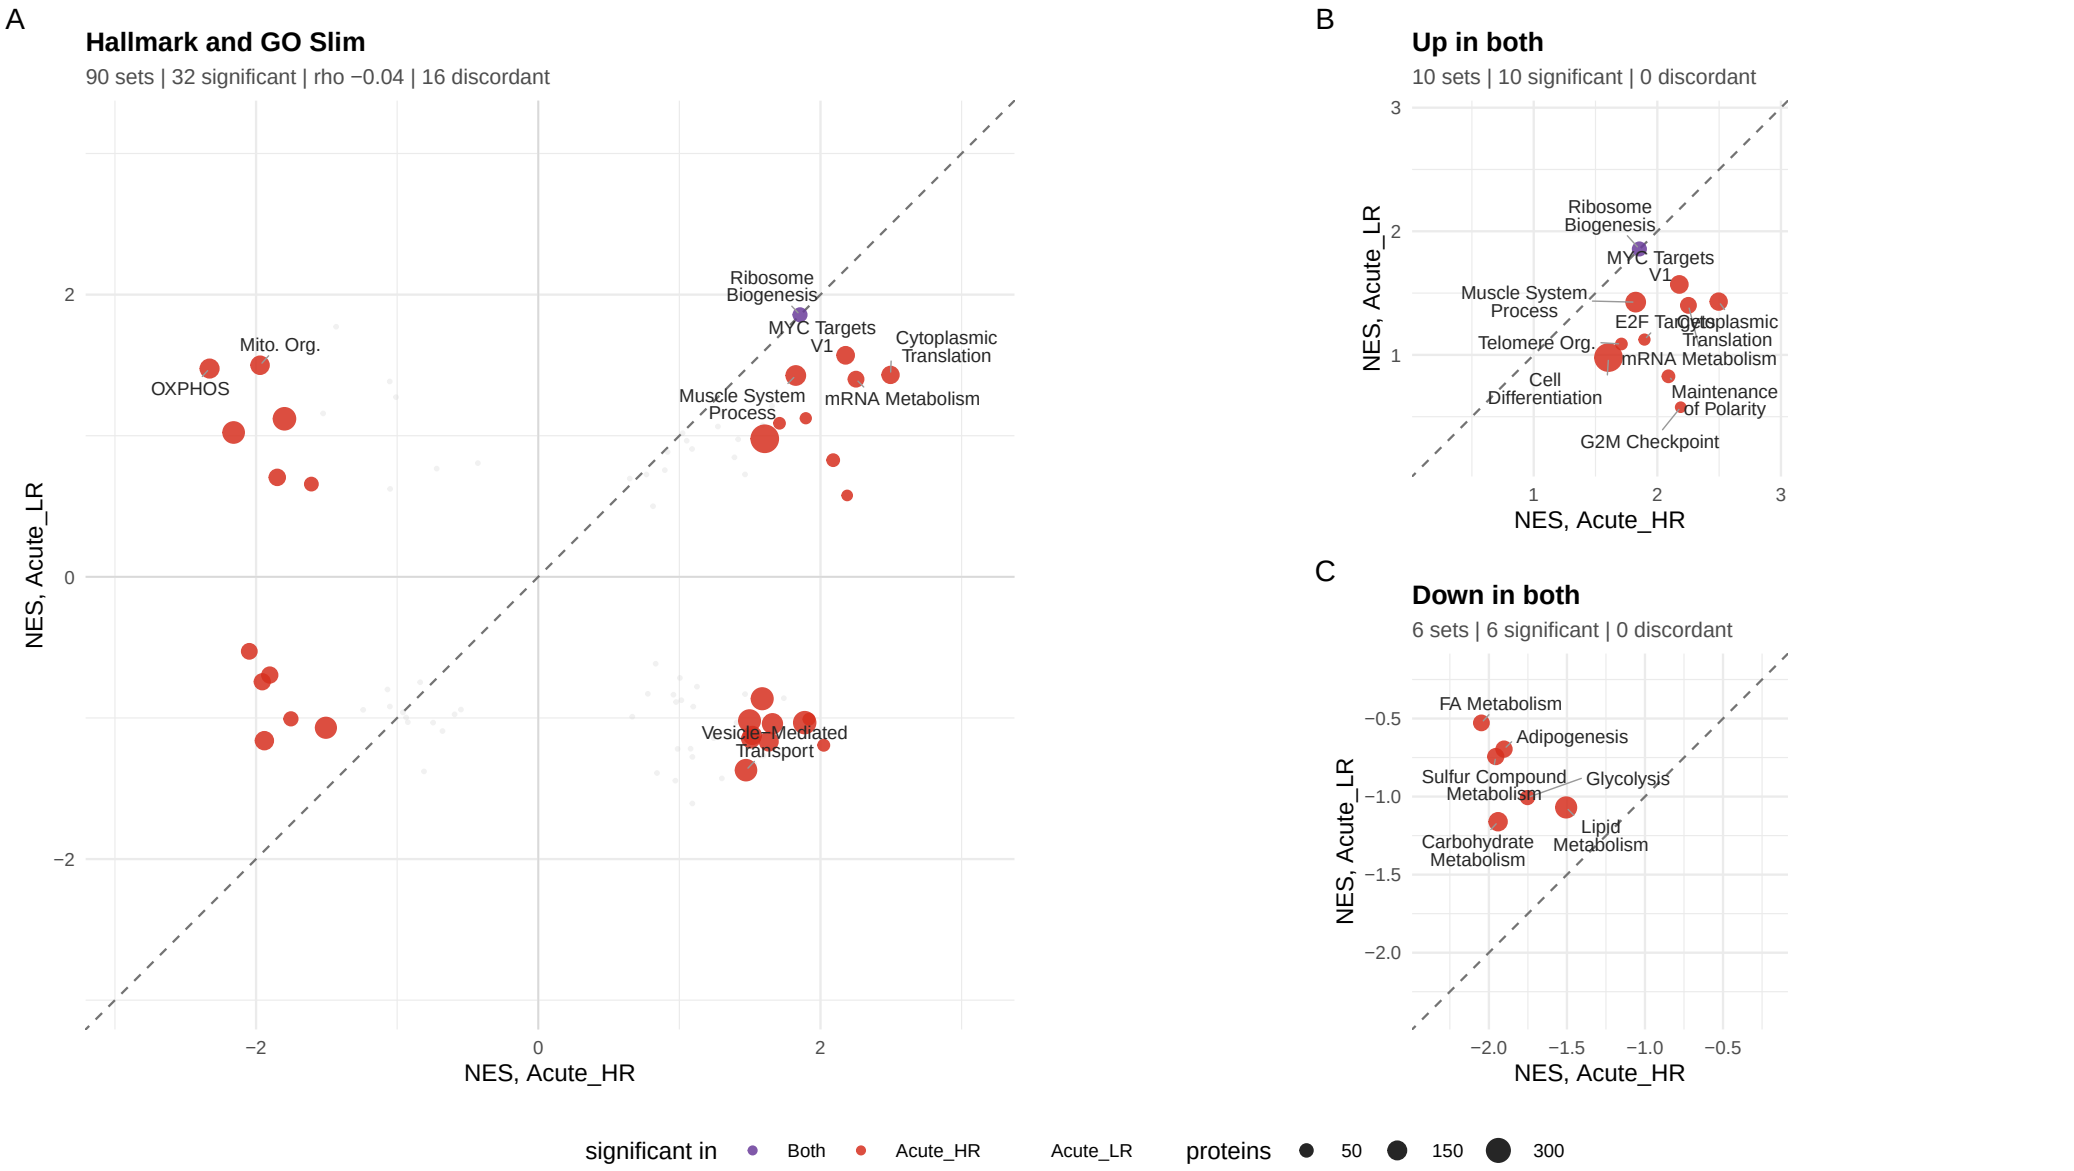

fgsea NES per contrast, 1370 sets, BH within contrast

One point per gene set, scored in both acute contrasts. Dashed line is identity; grey points reach neither threshold. Discordant sets are significant in at least one arm and sit on opposite sides of zero. Panel C rescales them
