

Imputation QC. The null holds under every imputer that does not impute inside the tested factor

Non-imputed reported arm vs four imputation methods. missForest is the canonical downstream matrix.

A

BH-significant proteins (q < 0.10): the metric the result rests on

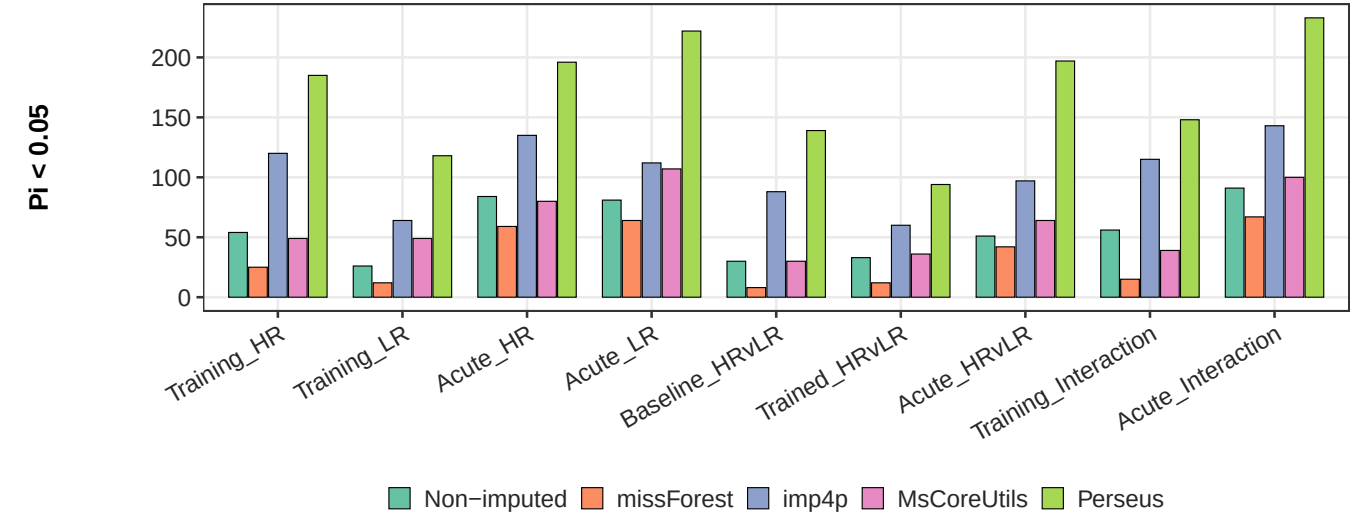

Zero under every imputer except imp4p, which imputes inside the Group_Time cells the contrasts test

B

Pi-selected proteins: not comparable across arms

Pi exponentiates |log2FC|, the quantity imputation distorts. Perseus tops this panel and is null in panel A.

C

logFC concordance, by how many values were missing

A rank correlation cannot see imp4p's failure, which is a variance collapse. Diagnostic, not a safeguard.
