

Nominal classifiers against chance

Chance is 5% of the 12 modules tested. With 6 to 8 pairs the Wilcoxon p is coarse, so fewer than 5% of null tests reach 0.05 and a ratio below 1 is not worse than chance.

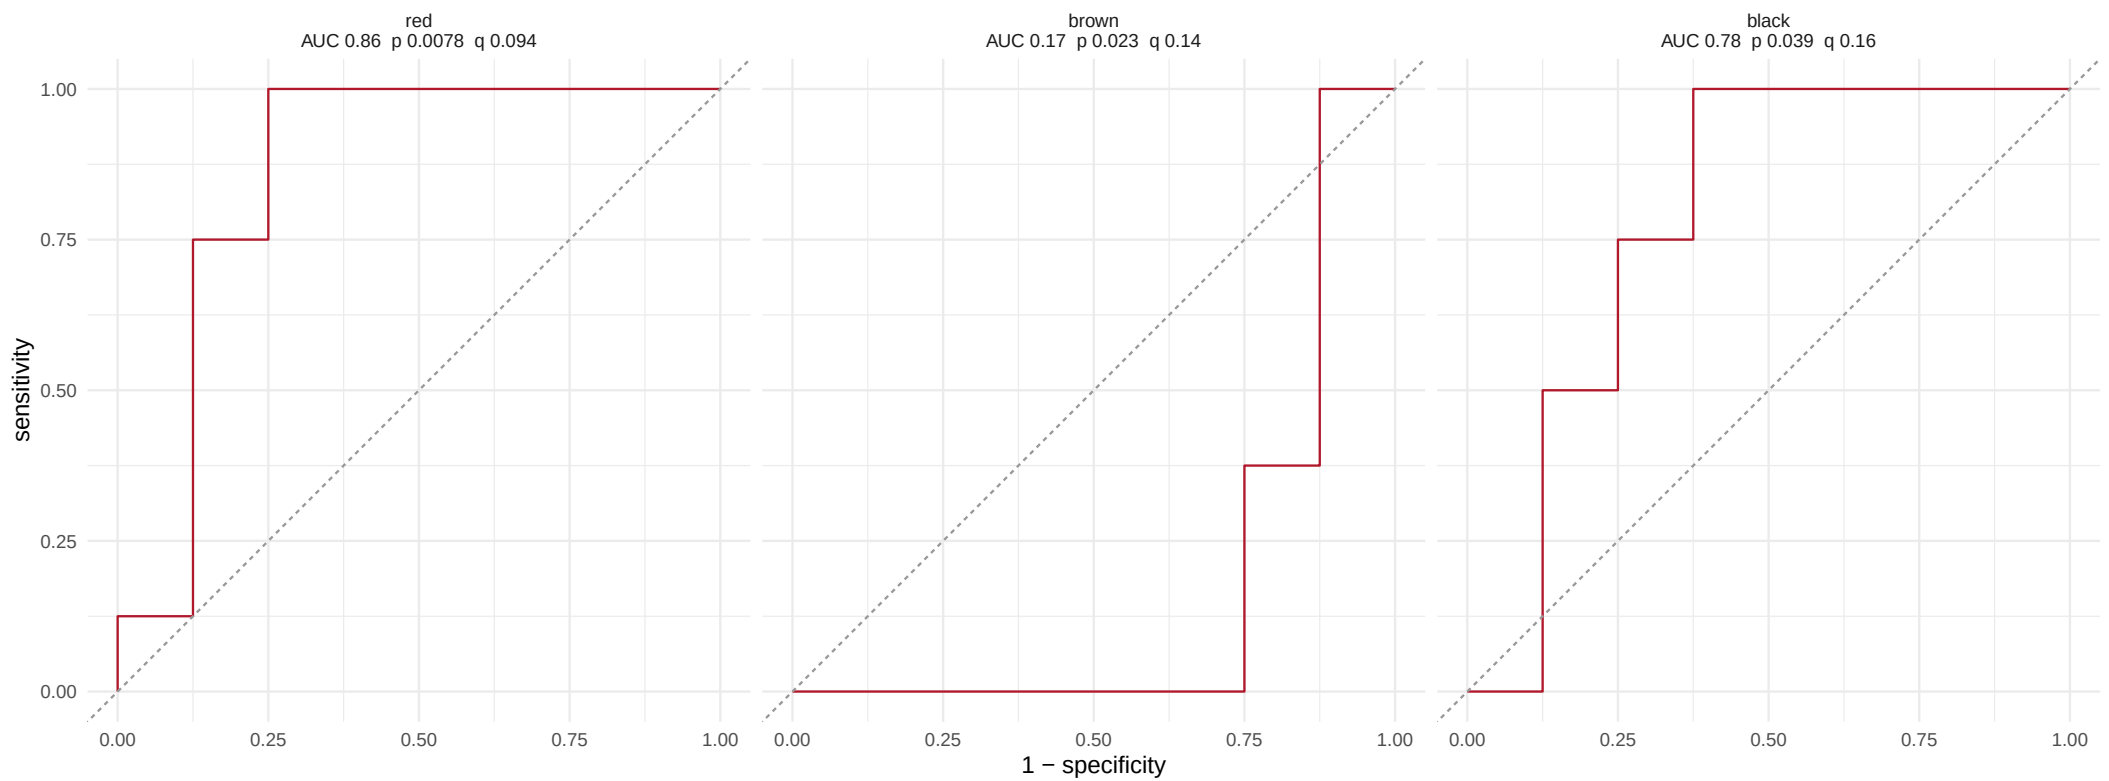

Acute bout, HR (T2 to T3)
eigengene; AUC above 0.5 favours T3; 7 vs 7 paired samples; page 1 of 1

2 of 12 modules reach $p < 0.05$; chance predicts 0.6. Smallest attainable p: 0.016. p from the Wilcoxon signed-rank test, q from BH within task. Table: c_data/03_classify.xlsx, auc.

Acute bout, LR (T2 to T3)
eigengene; AUC above 0.5 favours T3; 8 vs 8 paired samples; page 1 of 1

3 of 12 modules reach $p < 0.05$; chance predicts 0.6. Smallest attainable p: 0.0078. p from the Wilcoxon signed-rank test, q from BH within task. Table: c_data/03_classify.xlsx, auc.
