a Biopsies form no natural clusters

Correlation of 48 biopsies, blood-corrected, in average-linkage order; 16 people
Gap statistic, PAM on 10 PCs: k = 1

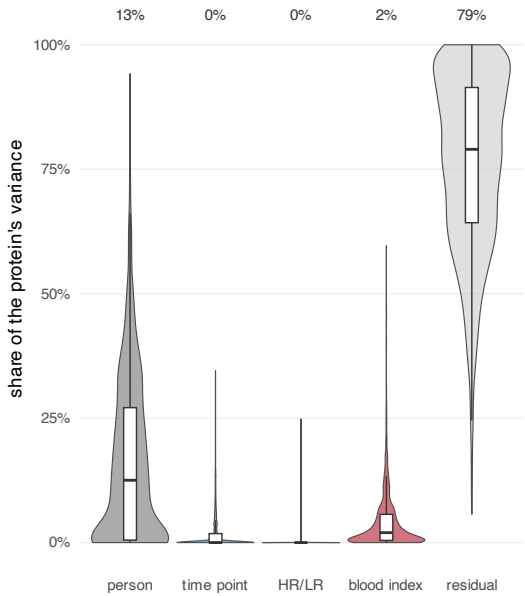

b Where the variance sits

variancePartition, 2,059 proteins; number: median share

d What drives the main components

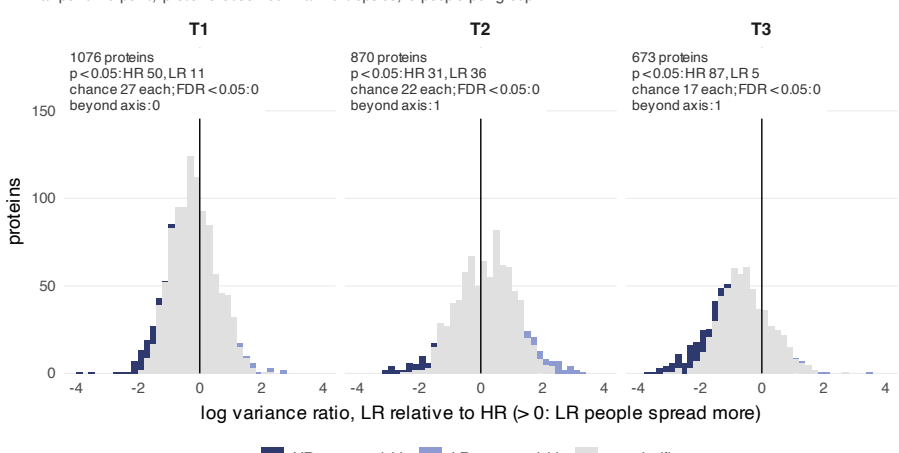

R^2 of each covariate alone; PC share of variance under its name

	PC1 16.9%	PC2 10.1%	PC3 7.3%	PC4 5.7%	PC5 4.2%
time point	0.01	0.05	0.24	0.01	0.14
HR/LR	0.03	0.06	0.02	0.01	0.13
person	0.48	0.43	0.44	0.43	0.72
blood index	0.02	0.02	0.07	0.00	0.00
proteins detected	0.85	0.04	0.04	0.00	0.00
sample weight	0.08	0.39	0.02	0.02	0.07

c Does one group vary more? (exploratory)

DiffVar per time point, proteins observed in all 16 biopsies, 8 people per group

e Proteome at T2 and T3

As Figure 1b for the trained and post-bout levels; at both, the forced second cluster is S28's thin biopsy alone
